User Manual

Mobile expense / household book for Android and Wear OS with KMyMoney integration

Version 1.1 · Updated: July 2026

Project: github.com/PerFermat/Ausgaben · License: GPL-3.0

Note: the screenshots show the German interface; the app is fully available in English as well (Settings → Language).

1. What is Ausgaben?

Ausgaben (German for “expenses”) is a mobile companion to the desktop finance software **KMyMoney**. Use it to record cash expenses, income and transfers on the go – right on your phone or a Wear OS watch – and transfer them into KMyMoney later, instead of typing everything in by hand.

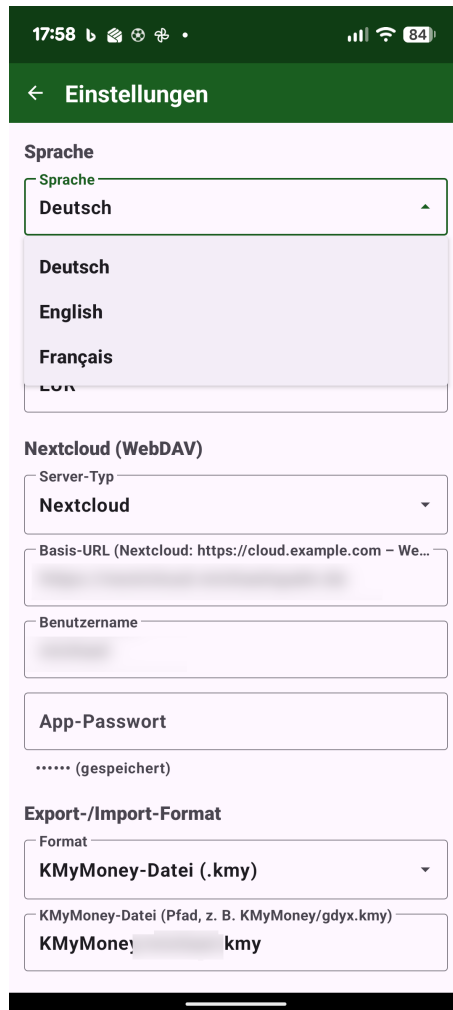

The app works fully offline and without any vendor account: data is exchanged with KMyMoney through a folder you provide yourself (Nextcloud, WebDAV or SMB/Samba). There are no ads and no tracking.

Key terms

- **Booking**: a single money event (expense, income or transfer).
- **Account**: e.g. “Cash”, “Checking”. Every booking belongs to an account.
- **Place (holding)**: *where* an account's cash physically is (wallet, jar, envelope ...).
- **Category**: what the money was spent on or received for (e.g. “Groceries”).
- **Alias**: a learned mapping “spoken term → correct payee” together with account/category.
- **.kmy**: KMyMoney's file format that is exported to and imported from.

2. Getting started

All of the settings below are reached via the gear icon ⚙ at the top right.

Settings: language, server connection (SMB/WebDAV) and export mode

Language

On first launch the language follows your phone (German → German, otherwise English). It can be changed any time under *Settings* → *Language* (at the very top).

Number format

Also in the language section you can pick the **number format**: “1.234,56” (grouping dot, comma), “1,234.56” (grouping comma, point) or “1234,56”/“1234.56” without grouping; plus a **“Show currency symbol”** toggle. The choice applies to all amounts in the app and on the watch. Amount entry still accepts comma and point; the CSV/kMy export keeps a stable format.

Set up the connection to your server (SMB or WebDAV/Nextcloud)

This is the most important setup step. For the app to exchange data with KMyMoney, it needs access to the folder that holds your shared **.kmy** file (or the export folder). Open the settings and choose the **server type**:

- **SMB/Samba**: for a Windows/NAS share on your home network (“smb://host/share”).

- **WebDAV (generic)** or **Nextcloud**: for a (cloud) WebDAV server.

Then enter URL/share, user name and password and verify with **“Test connection”**. Also choose the export mode (**.kmy** or CSV) and – in .kmy mode – pick the file via **“Choose .kmy”**. Full details are in Chapter 14.

Create accounts - required first

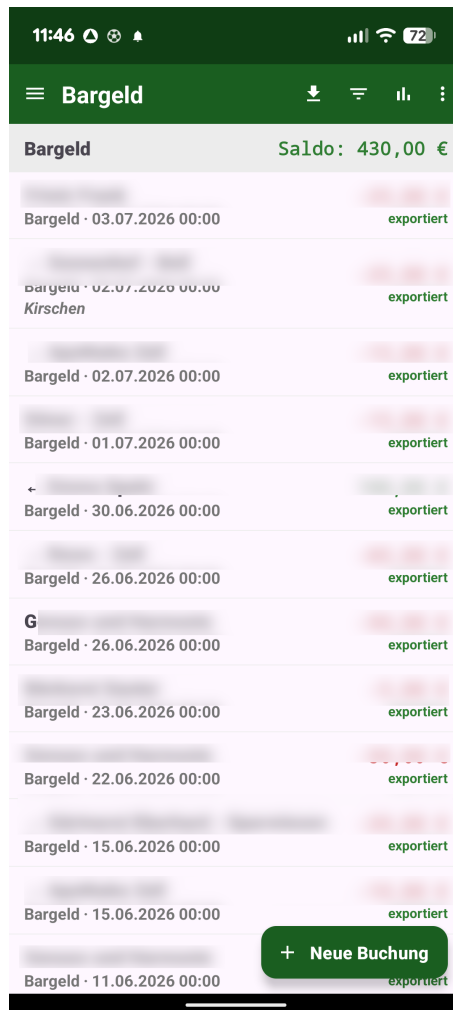

Next, create at least one **account**: in the account drawer (≡ top left) via **“Add account”**; in .kmy mode the accounts can be imported directly from the KMyMoney file. **Important:** the **default account** and the settings below it that depend on it (e.g. places per account) can only be set **once accounts already exist**.

App lock (optional)

In the settings you can enable the biometric app lock (fingerprint, face, PIN ...).

3. The main screen

The main screen shows the green title bar at the top, the **balance line** below it, and then the list of bookings. The action buttons are at the bottom right.

Main screen with title bar, balance line and booking list

Balance line (tap to cycle)

The coloured line below the title bar shows a balance. **Tapping** it cycles through, in order:

- **Account:** balance of the currently selected account (only when a single account is selected).
- **Total:** sum of all accounts.
- **Net worth:** all accounts + current portfolio value (only after a portfolio was imported).
- **Places:** balances of the account's individual cash places.
- **Filtered:** sum of the currently filtered bookings (only when a filter is active).

A green amount = positive/credit, a red amount = negative.

Home-screen widget

For the launcher there are four selectable widgets showing the **default-place** balance (default account → default place): **small** (2×1, balance only), **medium** (4×2, balance + three quick actions: booking, voice, amount), **large** (4×4, a balance header with refresh, the most recent bookings and the action bar) and **type** (4×2, like on the watch: three coloured income/transfer/expense icon buttons + a grey switch button, with the balance below). Tapping the balance opens the app; the medium/large widget buttons launch “New booking”, voice entry, amount-only entry or Holdings. On the **type widget** a type button **starts speech recognition immediately** and creates the booking directly – the app is not opened (only the system voice dialog appears); the grey **switch button** cycles through the chosen account and its places (the balance and the target of the new booking follow the selection). The widget refreshes when the app is opened and at regular intervals.

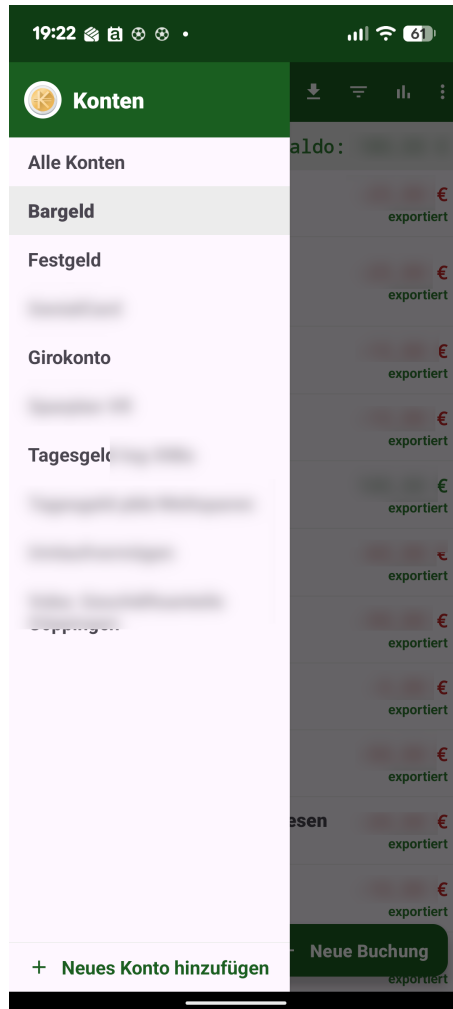

4. Symbol and control reference

This overview explains every symbol in the app and what it does.

Symbol	Name	Meaning / function
≡	Menu / account drawer	Top left. Opens the side drawer with all accounts, portfolios and “Add account”.
←	Back	Top left on sub-screens. Returns to the previous screen.
↓	Export / synchronize	Title-bar symbol (down arrow, download style). Starts the sync: writes new bookings into the .kmy or uploads them to the sync target.
▽	Filter	Funnel symbol. Opens the filter by payee, category and amount.
▦	Analysis	Bar-chart symbol. Opens the graphical analysis.
⚙	Settings	Gear. Opens the settings.
⋮	More items	Three dots (overflow). Contains “Holdings”, among others.
+	New booking	Round button at the bottom right. Short tap: record a booking. Long press: voice input.
⊞	Silent amount entry	Keypad symbol (only when location is enabled). Type just the amount; the payee is resolved via your location.
↑	To top	Small arrow. Jumps to the top of the booking list.
★	Preferred alias	Marks a preferred alias in the alias list (considered before bookings).
→	Alias mapping	In the alias list: “spoken term → correct payee”.
→ / ←	Transfer	In the booking list: → outgoing, ← incoming transfer (shows the counter-account/payee).
Split	Split booking	Marks a booking that is split across several categories.
exported	Exported	Small green hint: this booking has already been exported.
● red/ green	Amount colour	Red amount = expense/negative, green amount = income/positive.

Note: the title-bar symbols come from the Material Design set; their meaning is described above. Depending on space, some items appear in the “⋮” overflow menu.

5. Accounts and the account drawer

Account drawer with accounts, portfolio and "Add account"

- Open it via the ☰ symbol at the top left, or by swiping in from the left edge.
- **"All accounts"** shows all bookings together; a single account filters the list to it.
- **Long press on an account:** import/update that account from the .kmy.
- **Long press on "All accounts":** re-imports **all** existing accounts (full import).
- **Portfolios** appear at the bottom as "... (Depot)": short tap opens the portfolio view, long press updates it.
- **"Add account"** (at the bottom): loads the .kmy and offers the contained accounts for selection.

6. Recording a booking

Tap the round **+** button. The booking editor opens.

Booking editor with type switch, amount, payee and account

Arithmetic in the amount field

The **amount field** opens an **app-own calculator keypad** (digits, $\langle \boxtimes \rangle$, decimal key, *, +, **OK**) instead of the system keyboard and so also accepts a small **calculation** – handy when splitting a bill or adding up several items: $10+20*3$ gives 70, $100,50*2+25$ gives 226. Only **addition (+)** and **multiplication (*)** are allowed, with the usual precedence ($\times$ before $+$) and one decimal mark per number; minus, division, brackets and functions are **not** possible. Invalid characters cannot even be typed. $\langle \boxtimes \rangle$ deletes the last character (long-press clears the field); **OK** evaluates the calculation and replaces it with the result, an invalid one flagged with a message. The same applies to the **partial amounts** of a split transaction and the value quick-entry from the main menu. If the entry is incomplete, the amount simply stays empty.

Fields and controls

- **Type switch:** **Expense** · **Transfer** · **Income**. Sets the kind of booking.
- **Amount, payee, account** (chosen from existing accounts).
- **Date:** pre-filled with today; the **“Today”** button quickly sets the current date.

- **Note:** free text. With location enabled it automatically contains “GPS: lat, lon”.
- **Place** (only for expenses/income created in the app): which cash place the booking is credited to.
- **“Exported” toggle:** marks whether the booking has already been exported.

Saving

- **Save as new:** creates a new booking.
- **Update:** saves changes to an existing booking.
- **Delete:** removes the booking.

Date prompt when copying: if you open an existing booking, leave the date unchanged and “save as new”, the app asks whether the old date or today should apply.

Split booking (several categories)

In the “Split categories” section you can enter several categories with partial amounts. With one category the total and category amount are linked; with several, the sum must equal the total. Partial amounts may be negative.

Transfer

Choose the type “Transfer”, then the From and To accounts plus an optional payee. This creates a linked booking in both accounts (marked → or ← in the list). You can also choose a **from-place** and a **to-place**; then the respective place journal is updated (from-account –amount, to-account +amount). Editing or deleting the transfer rolls the place movements back.

7. Voice input and location capture

Voice input

A **long press** on the **+** button opens voice input. Say e.g. “barber 20 €”: the app looks for a matching template (payee, account, category, booking type) and opens it with today's date and the spoken amount. Payee search is fuzzy.

Nearest payee

If there are several payees with the same name (e.g. “REWE location 1” and “REWE location 2”) and the location is known, the app picks the **geographically nearest** one – both for existing bookings and for aliases with stored coordinates.

Amount-only entry (keypad ⌘)

With location enabled, the keypad symbol appears at the bottom. Type just an amount: the app looks for a matching template at your current location (100 m) and shows the resolved payee before you even save.

Alias names (learned mappings)

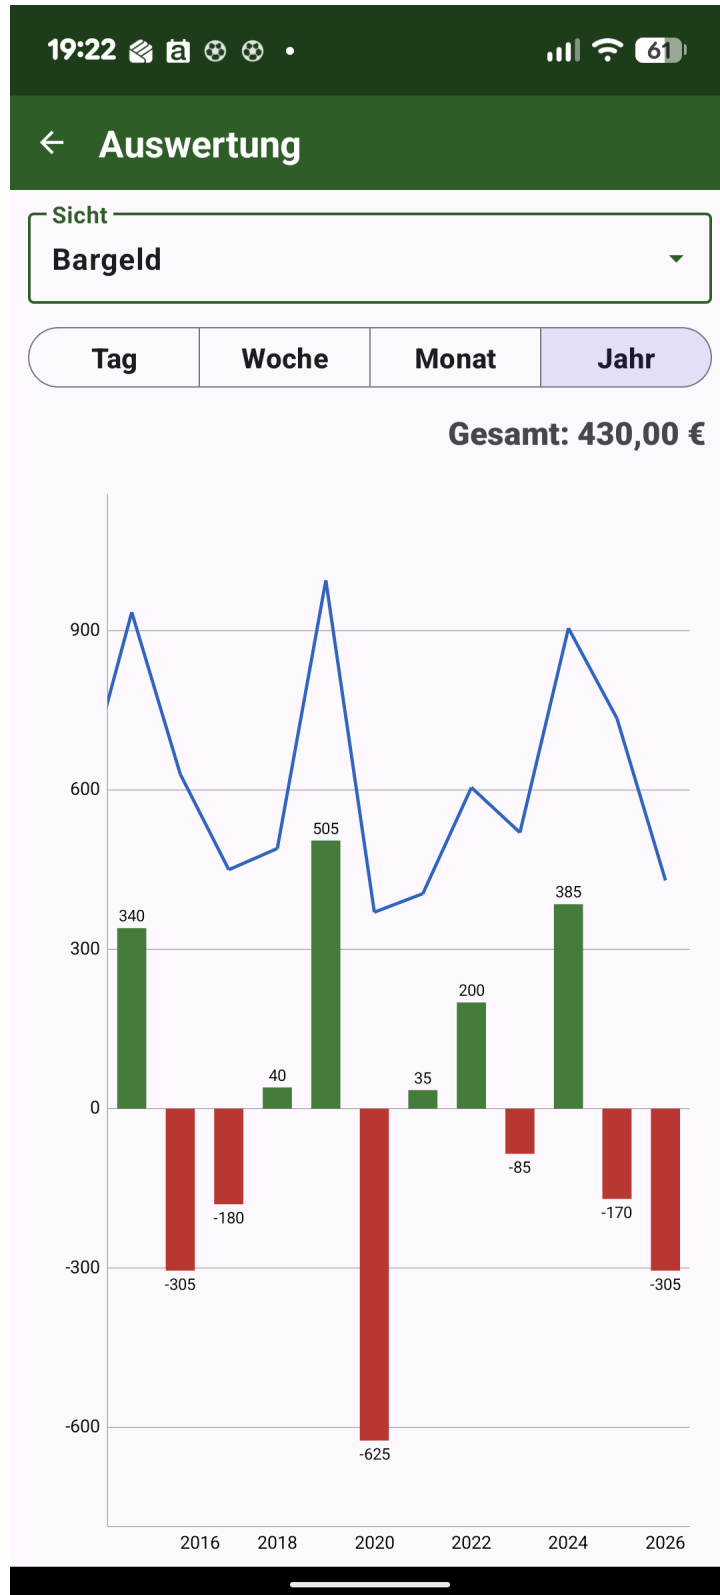

If you change the recognized payee while saving, the app asks whether to remember the mapping as an alias – together with account, category and **place** (for transfers the from/to accounts and from/to places). So “mom 100 €” is later booked automatically to the real name with the right account/place. The category and place fields in the alias form behave like the booking editor (grouped category picker; a place field only for accounts that have places). Resolution order: **preferred aliases (★) → bookings → remaining aliases**.

An alias can hold **any number of locations** (e.g. several branches). In the alias form, “Add coordinate” adds a row with latitude/longitude and “Open map”; the minus button removes a coordinate. When resolving (amount-only/voice) the alias matches if the current location is near **any** of its coordinates. Re-learning an alias from a booking at another place **appends** the coordinate (it does not overwrite).

8. Booking list and filter

- **Short tap** on a booking opens it as a read-only view (same layout as the editor, but without any editing): a large coloured heading shows the type (income = green, transfer = yellow, expense = red), and the balance before and after the booking is shown at the bottom. **Long press** opens it for editing.
- In the list the note is truncated to at most two lines; in the editor the note field spans four lines.
- **Pull down** (in an account or portfolio view): in the **kmy variant** the .kmy file is re-read and that account or portfolio is refreshed. In the **CSV variant** this is not available – there you refresh an account via the account menu (long-press the account in the drawer).
- Markers: “Split”, → / ← (transfer), “exported”; colours red/green.
- **Filter** (funnel ▾): with a **search field** that searches **payee, note and category** (substring, case-insensitive – so you can find a booking by its note as well); plus category (as a tree), amount (slider) and **date from-to** (slider in whole-month steps; type an exact day into the field). The filter applies to the list and the analysis. With a category filter a split booking shows only the partial amount of the chosen category.
- **Undo**: after deleting a booking, “Undo” appears briefly at the bottom – one tap recreates it. It gets a new internal number; in the place journal the deletion and the recreation stay visible as movements (the history is preserved, the balance is correct). Transfers have no undo.
- **Long press on the app icon** (home screen): “New booking” opens the editor directly.

9. Analysis

Analysis as a bar and line chart

- Periods: day / week / month / year.
- Views: single account, place or total.
- **Zoom by gesture:** horizontal = number of bars, vertical = Y axis.
- Closed accounts count only in the total view (historical balance).

10. Where does my money go?

The **Categories** page (menu ☰ → **Categories**) shows the **expenses per category** – as a pie chart and below it as a list, sorted **descending** by amount. It complements the analysis (chapter 9), which only shows the development over time per account/place.

- **Month/Year** toggle: current month resp. current year.
- In both views you page through the periods by **swiping** – just like in the budget (right = back, left = forward); the header shows the displayed month resp. year centred and bold, with the previous and next one in grey to the left and right (tapping pages as well). Paging stops before the first booking period and after the current one.
- The chart uses the **full width** and at most **half the screen height**; the list below scrolls on its own while the chart stays visible.
- The slices are unlabelled; a **tap** shows category and amount in the centre, without a selection the total is shown there. The list additionally states the **share in percent**.
- **Split transactions** count through their partial amounts (not twice), **transfers** are left out – the same data source as the budget page.
- The analysis covers **all accounts** and lists only categories with expenses.

Include scheduled transactions (calendar icon)

The **calendar toggle** at the top right adds the **scheduled expenses due** in the period (chapter 8) to the ones already made. Then:

- The **sum per category** grows by the scheduled share; the list sorts by the new sum.
- In the chart the **already paid** share appears in the category's strong colour, the **scheduled** share right next to it in the **same, lighter** shade – together they form **one continuous sector** with no separator between them.
- Rows with a scheduled share can be **expanded** (arrow on the right), showing “Already paid” and “Scheduled” separately.
- With the toggle on, the slider also pages into **future** months/years – which then show only scheduled values – up to the last scheduled occurrence.

Set colours (palette icon)

Each category has a **fixed colour** – regardless of its current position in the list. The **palette icon** at the top right opens the colour list: tapping a category opens the picker; “Default” restores the automatic colour. The assignment takes effect immediately in the chart and list.

11. Budget

The **Budget** page (menu ☰ → **Budget**) puts the **actual** value against a per-category **target**. It answers the question: “Am I on plan?”

Where does the target come from?

- **Import from KMyMoney** (a button in the settings): if your .kmy contains a budget, its values are taken as the target — **month-accurate** (monthly and month-by-month budgets are stored per month). Such targets are **not editable**.
- **Compute from history**: sum of all previous years ÷ number of years with data. Automatic when the “compute budget internally” switch is on, otherwise via a button. These targets can be edited by a **long press on a row**.

Whether a category is **income or expense** is taken reliably from the KMyMoney type in the .kmy file (not from the sign of individual bookings). A refund therefore reduces the expense category without turning it into income; a computed negative actual is clamped to 0.

Display

- Toggle **year / month**. The year view sums the months; the month view shows the displayed month's target against that same month's actuals. In month view you page through months with a **swipe** (or by tapping the grey previous/next month in the header).
- Toggle **main categories only / with subcategories** (a main category sums its subcategories).
- **Income** first, then **expenses** (large headers); main categories bold, subcategories indented. The right side shows “actual / target”.
- Under each category a slim **bar**: **green** when on plan, **red** when behind (width = share of the target used). Instead of a purely linear time comparison, the app learns each category's typical timing from the **payment history**: a **one-time** expense (e.g. a transit pass bought at the start of the month) is green as soon as it is within budget, while **regular** expenses (groceries) are still measured against the elapsed time. Without history the linear comparison applies (for income reversed).

12. Scheduled transactions

The **Scheduled transactions** page (menu : → **Scheduled transactions**, shown only in **.kmy mode**) imports the standing orders / schedules set up in KMyMoney and shows them as **one chronological list** by due date. The schedules are **not** refreshed by the normal account import; they update only when you use the **pull-to-refresh** gesture on this page – with the familiar **yellow progress banner**.

- Each recurring schedule is **expanded into its individual occurrences** (e.g. a weekly bakery appears several times) — from the stored next due date up to **2 years** ahead.
- Only **active** schedules; entries **without a date** are skipped, and an **end date** (or a limited number of payments in KMyMoney) limits the preview.
- A coloured **strip** precedes each row: **green** = deposit, **red** = payment, **yellow** = transfer. The **date** is its own column at the front, next to it the **name** with the **payee** in smaller, grey text behind it and below it the **category** (with several categories “**Split transaction**”), then an **account column** and the amount on the right. For a **transfer** the account column shows **both accounts, one below the other** (instead of a category).
- The **type** is taken strictly from KMyMoney: a **stock/ETF purchase** (savings plan) is a **transfer** from the cash account into the security – not an expense.
- A **tap on a row** opens the transaction in the **familiar detail view** (read-only, exactly like a real account movement – including the categories of a split transaction and the balance before/after).
- **Book now:** a **long press** on a row opens the booking editor as a **new booking**, prefilled from the schedule (date = due date, amount, payee, account, categories resp. from/to). Check it, adjust if needed and save with “New booking” – it lands in the account and (with a place chosen) in the holdings. The schedule itself is untouched; it comes from KMyMoney and is never written back by the app. Tap = view, long press = book – just like in the booking list.

Reminder for due transactions

If you want, the app reports once a day when something is due **today** (“3 scheduled transactions due today”); tapping the notification opens this page. The switch “**Remind me of due transactions**” is in the settings and is **off by default**; when switching it on the app asks once for the notification permission. If nothing is due, no notification appears.

Balance strip (cycling)

At the top – like in the normal account view – a **balance strip** (label on the left, amount on the right) that always reflects the **currently set filter**. Each **tap** cycles the display:

- **Surplus or deficit** (default) = total deposits – total bills; only the applicable state is shown (green = surplus, red = deficit).
- **Total deposits** (green).
- **Total bills** (red).
- **Transfers** (yellow) = sum of all scheduled transfers.

Transfers count towards **neither** deposits nor bills (they only move money between your own accounts) and therefore have their own line.

Filter

The **filter icon** at the top right narrows the list (and thus also the balance strip and the chart) by:

- **Type:** deposits, bills, transfers (each can be toggled on/off).
- **Account:** single selection from a list of all accounts (or “All accounts”).
- **Name:** search text matched against **name or payee**.
- **Period:** slider (month granularity) or direct, day-precise date entry.

Chart

The **chart icon** at the top right opens an analysis that **looks exactly like the account view's chart**: green/red **bars** for deposits and bills and a **development line** of the selected account or of total wealth. You can pick the **view** (total or a single account) and the **time unit** day/week/month. The line **starts at 0 at the beginning of the observation period (= today)** and can be **zoomed and panned** like the account chart; it starts at the far left (today) and runs to the right into the future. The chart inherits the list filter. For a **transfer** the amount decreases on the **source account** (red) and increases on the **target account** (green) – the direction (“pay to” or “from”) is taken from KMyMoney.

When you scroll far down, the **scroll-to-top button** (bottom left) jumps straight back to the start of the list.

13. Holdings (places) and portfolio

Holdings / places - what are they?

A **place** describes **where** an account's cash physically is – e.g. wallet, jar, petty cash or an envelope. An account “Cash” can thus be split into several real storage locations. **This feature does not exist in KMyMoney**; it is an addition of this app for everyday cash handling.

Places are **not limited to cash accounts** – they can be used for **any account**. In the following examples we stay with cash, though.

Reached via ⓘ → **Holdings**. Each place keeps its own **movement journal**; its balance is the sum of its movements. The sum of all place balances always equals the account balance:

“no place” is the automatically computed remainder (account balance – sum of the other places). So the account stays consistent no matter how many places you create.

- A booking created in the app automatically produces a movement on the account's **default place**.
- Place movements can be **created, edited and deleted** individually.
- Money can be **transferred between places** (e.g. to assign an imported booking to a place, or to move cash from the envelope into the wallet).
- Later amount or deletion changes append dated balancing movements – the history is preserved.

Place on old (imported) transactions

A transaction that was **exported and imported again** loses its place link – that is intended. If you still open such a transaction **for editing** (long press), the **place field is shown** as soon as the account has any places, so you can pick one. What happens then depends on the button you press:

- **“New transaction”** (duplicate): a **new** transaction is created – the chosen place **is saved** and a movement is added in the holdings. This is the way to give an old transaction a place afterwards.
- **“Update transaction”** on a transaction that had **no place before** and is **already exported**: the entered place is **ignored**, the place journal stays untouched.
- **“Update transaction”** on a transaction that **had a place before**: the new place **is saved** and followed up with balancing movements (old place –amount, new place +amount).

In the plain **view** (short tap) the place field stays hidden for imported transactions, as before. The same applies to **transfers** – there you get a from-place and a to-place, and the movement is created on **both accounts**.

Cash count at place level

A particular advantage: the **cash count** (reconciliation) can be done **per place**. You count only the cash of *one* place – say the wallet – enter the counted amount, and the app automatically books the difference as a balancing movement. So you don't have to reconcile the whole account at once; this **simplifies reconciliation considerably**. Imported bookings carry no place link.

Asset and liability accounts

Accounts are grouped by their KMyMoney type into **asset accounts**, **liability accounts** (loans, credit cards) and **portfolios** – with colour-coded section headers (assets green, liabilities red, portfolios blue; light theme → lighter colour/black text, dark theme → darker colour/white text) both in the account drawer and in the holdings view. In holdings each category header shows its **category total** right-aligned; the portfolio counts as one line (portfolio value) towards the **total** (in a neutral grey/black). The split is taken from the .kmy on import (visible after a re-import).

Portfolio (securities)

After importing a KMyMoney investment account, the **portfolio** appears in the account drawer. The portfolio view is laid out exactly like an account view – same **menu bar** (hamburger menu on the left, portfolio name as the title, and on the right the same menu items as a normal account) plus drawer and filter – and shows **shares × price = current value** per security; fully sold securities are hidden. The **balance line toggles by tap** through portfolio value → buys → sells (if any) → dividends (if any) → **net invested** (buys – sells – dividends) → **gain/loss** (coloured, with percentage). The **portfolio filter** narrows the securities by name and value (slider). When you scroll far down, the **scroll-to-top button** (bottom left) jumps straight back to the start. A tap on a security opens its **movements full-screen** (buys green, sells red, dividends neutral) with the same figures for that security plus a **filter by buys/sells/dividends** and a date slider (start date = first purchase). The portfolio value is kept separate and also appears as “Net worth” in the main screen's balance line.

The “**Analysis**” menu opens a **pie chart** of the securities (share of the portfolio value). The slices are unlabelled; a tap shows the **name and amount** of the security in the centre, and with nothing selected the centre reads “Total: <portfolio value>”. The **Export** in the portfolio menu runs right in the portfolio (no switch to the cash view).

Dividends gross/net: the settings let you choose whether dividends are shown gross (declared dividend) or net (cash received after tax) and used in the balance line (dividends, net invested, gain/loss). The net value is captured on portfolio import – for existing data a one-time re-import is needed.

14. Synchronizing: performing export and import

The actual sync with KMyMoney runs through a **single symbol** in the main screen's title bar – the **export/sync symbol** (down arrow).

The export/sync symbol in the title bar (circled in red)

Exporting bookings

Tap the export symbol ↓. The app loads the current .kmy from the sync target, inserts your new bookings, makes a backup first (see below) and writes the file back. Each booking is exported only **once** and then marked “exported”. In CSV mode one CSV file per account is uploaded instead.

(Re-)importing accounts

Import is done selectively via the account drawer (long press):

- **Long press on an account:** imports/updates exactly that account from the .kmy.
- **Long press on “All accounts”:** re-imports **all** existing accounts.
- **“Add account”:** fetches an account not yet present from the .kmy. In the picker you can tick **several accounts (and portfolios) at once; already-imported accounts (including closed) and portfolios are hidden.**
- **Long press on the portfolio** (or pull-to-refresh in the portfolio view): updates securities and prices – also in the background with the yellow progress banner.

Securities buys and sells (money from the account into a security or back) are imported as a **transfer** into/out of the security. This keeps the full purchase amount from wrongly counting as “bank fees”. The actual small **fee** (or tax) inside the transaction does **not** appear in the booking list and changes no balances – but it is counted as a small expense in the **category evaluations** (chapter “Where does my money go?” and Budget). **Dividends** stay normal income. To convert old, already-imported buys, re-import the affected account once.

An import replaces the already-exported bookings per account (no duplicates). The import runs **in the background** – the UI stays usable; a **yellow banner** at the top of the booking list (“Importing account ...”) with a moving gradient, status text and percentage shows the progress and disappears when done. A message appears **only on error**. In **CSV mode with SMB/WebDAV**, adding an account or long-pressing one opens a **navigable folder browser** (subfolders □ + CSV files, “..” to go up); the chosen CSV is imported from the current folder. The drawer stays open on long press.

What the progress in the banner means

The percentage follows four phases, each with a real reference value – so it keeps moving instead of jumping:

- **0-30 % “Reading file...”:** the downloaded bytes of the .kmy. If the server reports no file size, the display stays at 0 during this phase – the import still runs.
- **30-45 % “Reading file...”:** the file is unpacked and prepared.
- **45-70 % “Reading bookings...”:** share of the bookings read (the count is in the file header).

- **70-99 %**: the bookings are saved; **100 %** = done.

Each value is reported **after** a step of work. With very many bookings the display may rest at 99 % briefly before it jumps to 100 %.

To keep the import quick, the app reads the file **once for all selected accounts** and saves everything in one go. Prices, budgets and scheduled transactions only appear **after** the bookings in the .kmy — the app jumps straight there instead of walking through the whole ledger again for each of those parts.

Backup before every export

Before every write-back the app automatically creates a **timestamped backup** of the .kmy (e.g. *file.kmy.bak-YYYYMMDD-HHMMSS*). The backups go into the **“Backup” subfolder** next to the original; the folder is created automatically the first time. So you always have a fallback in case something is ever wrong with the file, and the actual folder stays tidy.

Protection against overwriting

A few seconds pass between downloading the .kmy and writing it back. If somebody works in KMyMoney on the computer during that window, their changes must not be lost. The app therefore remembers the **state of the file** when downloading and only writes if it is unchanged:

- **Nextcloud/WebDAV**: via the file's **ETag**; the server itself performs the check (*If-Match*), so it is gap-free.
- **SMB/Samba**: via change time and size, checked immediately before writing.

If the file changed in the meantime, the **export aborts and writes nothing**; the bookings stay unexported and can be exported again after a fresh import, without any loss. If the server reports no state, the app writes unchecked as before – the export never fails because of this.

15. Setting up synchronization (Settings)

Before synchronizing for the first time, store server, access and export mode once in the settings (shown in Chapter 2).

Server type and access

- **Nextcloud:** base URL of the server + app password (Nextcloud → Security → App password).
- **WebDAV (generic):** full DAV root URL, auth via HTTP basic.
- **SMB/Samba:** “smb://host/share”; empty user = guest, a domain as DOMAIN\user. SMB2/3.
- **“Test connection”** checks the credentials; in .kmy mode **“Choose .kmy”** opens a file browser with subfolders and .kmy files – descend into subfolders and go back up with “..”.

Export mode

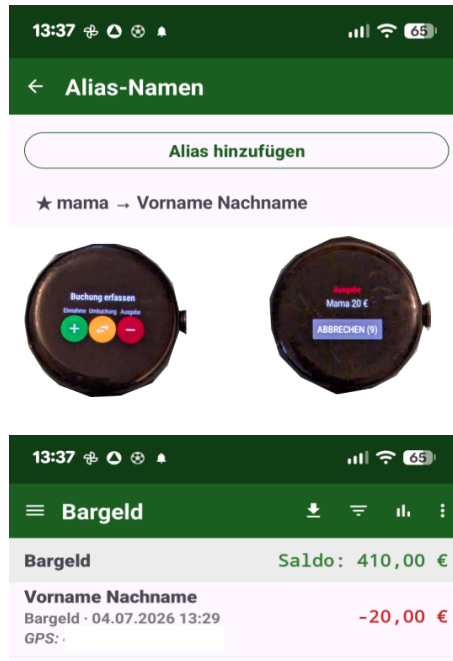

- **.kmy mode:** writes new bookings straight into the KMyMoney file (including splits and transfers) and imports accounts/bookings as well as the portfolio from it.
- **CSV mode:** exports one CSV file per account; each booking is exported only once.
- **Portfolio import:** reads securities, buys/sells/dividends and the latest price.

Without a configured sync target, export goes locally into a folder you choose.

16. Managing alias names

Under **Settings** → **Alias names**: the automatic prompt can be turned off (existing aliases still apply). Via **“Manage alias names”** you create, edit and delete aliases by hand – with spoken term, real payee, booking type, account, categories and location (settable via **“Open map”** on an OpenStreetMap map). The **“prefer”** toggle (★) puts an alias ahead of the booking search. The same spoken term may point to several payees, which are then distinguished by location.

17. Wear OS (watch)

Recording on the watch

With the watch app you record an expense by voice right on your wrist. The watch only captures the text; processing and creating the booking happen on the phone (the same parser).

- **Three type buttons:** income (green), transfer (yellow), expense (red). Then voice starts.
- The recognized text is shown for 10 seconds with “Cancel” and otherwise processed automatically.
- **Silent digit entry:** enter an amount silently via the digits symbol (resolved by location on the phone).
- **Location only after a fresh fix:** after input the watch waits up to ~1 minute for a fresh GPS fix and sends the booking only afterwards – instead of taking a possibly stale fix immediately. Without a fresh fix the last stored measurement is used (at most 5 minutes old), otherwise it is sent without coordinates. This keeps a payment from landing at a previously visited place after you have moved.
- **Wear tile:** quick access as a tile.
- **Default-place balance:** below the buttons, the app and tile show the balance of the default place as “Place: balance” (e.g. “Wallet: 70.00 €”). The phone sends the value only when it changes; the watch reads it on start and reacts via push – no polling, no noticeable battery drain. No default place set → line hidden.
- **Reason instead of balance:** while bookings are **not yet transferred**, this line shows the **reason** instead of the balance – “Waiting for GPS” (the location is still being resolved), “No connection to phone” or “Transferring...”. The line below still states the count.
- **Switch account/place:** above “Record booking” (centred), a grey switch button – in the app and the tile – cycles through the shown account and its places; the next booking (phone widget and watch) then targets the chosen account/place. For a transfer the chosen account is the from-account; the to-account is the default account – unless the chosen account already is the default, in which case the to-account stays empty (to fill in manually on the phone). After 60 s the selection reverts to the default place.

- **Offline:** bookings not yet transmitted are shown and delivered automatically once the phone is reachable – without loss and without duplication.

Requirement: the phone and watch apps share the same signature (same key).

18. Security, privacy & settings

- **App lock:** optional via biometrics/device credential (fingerprint, face, PIN, pattern, password) – on start and when returning from the background.
- **Location (GPS)** switch (default **off**): controls all location use. Off = no permission prompt, no GPS note, no amount-only entry, no alias location. The position is used locally only, never sent to a service.
- **Currency symbol:** default; taken per account from the file on .kmy import.
- **Theme:** light/dark. **Backup/restore** of the database.
- **Delete/close account:** a **multi-select** lists all accounts with status (Active/Closed). The bottom row has **Delete** and (context-dependent) **Close/Reopen** before **Cancel**; **Close** appears only when all selected accounts have a balance of 0, **Reopen** when all selected are closed – so several accounts can be closed, reopened or deleted at once. A closed account no longer appears anywhere – only in the total analysis view does its historical balance still count.

Disclaimer

This app is provided as-is, with no warranty. In particular, there is no guarantee that the .kmy file remains fully valid after an export. Thanks to the automatic backup before every export, however, you always have a fallback. Keep your own regular backups as well.

19. CSV format (export)

German locale: column separator “;”, decimal separator “,”, date DD.MM.YYYY, UTF-8. Split bookings are written as one line per category.

```
Datum;Empfänger;Konto;Typ;Betrag;Notiz;Kategorie  
29.06.2026;Metzgerei;Bargeld;Ausgabe;-7,30;Mittagessen;Lebensmittel
```
