1. What is Ausgaben?

Ausgaben (German for „expenses“) is a mobile companion to the desktop finance software **KMyMoney**. Use it to record cash expenses, income and transfers on the go – right on your phone or a Wear OS watch – and transfer them into KMyMoney later, instead of typing everything in by hand.

The app works fully offline and without any vendor account: data is exchanged with KMyMoney through a folder you provide yourself (Nextcloud, WebDAV or SMB/Samba). There are no ads and no tracking.

Key terms

- **Booking**: a single money event (expense, income or transfer).
- **Account**: e.g. „Cash“, „Checking“. Every booking belongs to an account.
- **Place (holding)**: *where* an account's cash physically is (wallet, jar, envelope ...).
- **Category**: what the money was spent on or received for (e.g. „Groceries“).
- **Alias**: a learned mapping „spoken term → correct payee“ together with account/category.
- **.kmy**: KMyMoney's file format that is exported to and imported from.

2. Your first booking in five minutes

This chapter walks you once through the whole cycle: set up, book, transfer. It names only the straight path and no exception. Everything else – every field, every subtlety – follows in the later chapters.

1. **Set up the connection.** On first start the welcome assistant appears. Choose your language, then „**KMyMoney file (.kmy)**“ as the format, and enter your server (Nextcloud, WebDAV or SMB). „**Test connection**“ tells you right away whether it works.
2. **Pick your KMyMoney file.** „**Choose .kmy**“ lists the files in the folder you configured. Take the one you work with on the desktop.
3. **Import your accounts.** „**Import accounts**“ lists the accounts in that file. Tick the ones you need while out and about – usually a cash and a checking account. „**Done**“ closes the assistant.
4. **Record your first expense.** Tap the round **+** button at the bottom right. Enter the amount, pick payee and category from the list, then „**Save as new**“. The booking appears in the list immediately.
5. **Transfer it to KMyMoney.** Tap the **export symbol** **↓** in the title bar. The app fetches your .kmy from the server, writes a backup, adds the new bookings and puts the file back. On the desktop you then open it as usual.

That is the entire cycle. From now on only steps 4 and 5 repeat: record while you are out, export when it suits you. Each booking is transferred exactly once.

No KMyMoney file? In the assistant pick the format **CSV** instead of .kmy. The app then exchanges one CSV file per account. Everything else stays the same.

Where to go next: the welcome assistant in detail is in the next chapter, recording a booking in Chapter 7, syncing with KMyMoney in Chapter 15, and every single setting in Chapter 17.

3. Getting started

Welcome assistant on first start

As long as **no account** exists yet, a slim **welcome assistant** appears automatically when the app starts. It bundles the most important starting points in one place and can only be opened automatically (no menu entry).

- Choose the **language** (takes effect immediately).
- **Import/export format**: CSV or KMyMoney file (.kmy).
- **Synchronisation**: server type, URL, user, password – with „**Test connection**“; in .kmy mode also „**Choose .kmy**“.
- „**Import accounts**“: the same selection dialog as „Add account“, right here in the assistant.
- „**More settings**“ opens the full settings; „**Done**“ closes the assistant.

„Import accounts“, „More settings“, „Done“

Language, format and synchronisation

Important - an account first: create at least one **account** – in the assistant via „**Import accounts**“ or later in the account drawer (≡ top left) via „**Add account**“. The **default account** and the options that depend on it (e.g. places per account) can only be set **once accounts already exist**.

All settings in detail – language, number format, currency, server connection, export mode, default account, alias names, app lock, backup and more – are explained in the „**Settings**“ chapter at the end of the manual (Chapter 17). They are reachable any time via the **⋮ menu** at the top right, entry „**Settings**“ at the very bottom.

4. The main screen

Main screen with title bar, balance line and booking list

The main screen shows the green title bar at the top, the **balance line** below it, and then the list of bookings. The action buttons are at the bottom right.

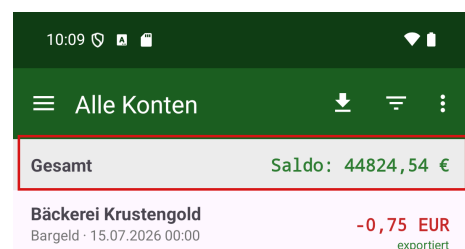

Balance line (tap to cycle)

The coloured line below the title bar shows a balance.

Tapping it cycles through, in order:

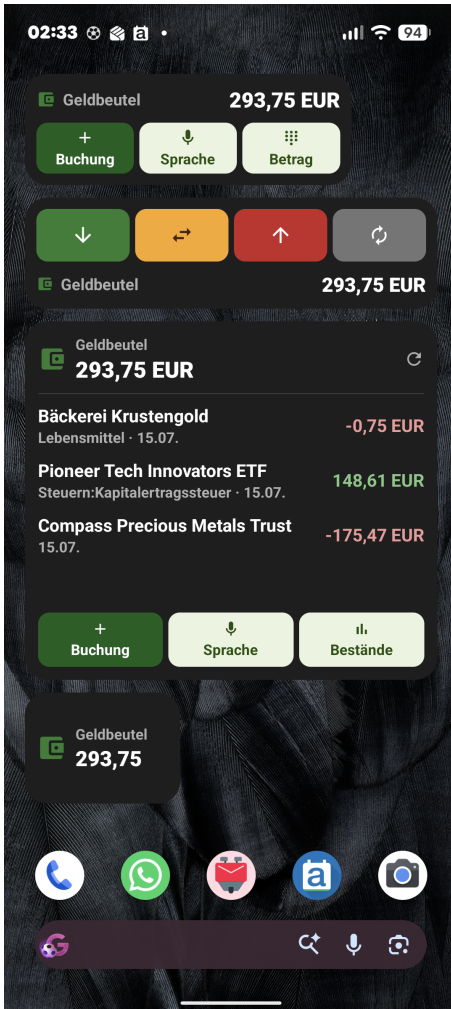

- **Account:** balance of the currently selected account (only when a single account is selected).
- **Total:** sum of all accounts.
- **Net worth:** all accounts + current portfolio value (only after a portfolio was imported).
- **Places:** balances of the account's individual cash places.
- **Filtered:** sum of the currently filtered bookings (only when a filter is active).

A green amount = positive/credit, a red amount = negative.

Balance line with group total; tapping cycles through

Home-screen widget

All four widget sizes: medium, type, large and small

For the launcher there are four widgets. All of them show the **default-place** balance (default account → default place), and tapping the balance opens the app.

- **small** (2×1): the balance only.
- **medium** (4×2): the balance and three quick actions – booking, voice, amount.
- **large** (4×4): a balance header with refresh, the most recent bookings and the action bar.
- **type** (4×2): like on the watch – three coloured icon buttons for income, transfer and expense, plus a grey switch button, with the balance below.

What the buttons do

On the medium and large widget the buttons launch „New booking“, voice entry, amount-only entry or Holdings – each of them inside the app.

Refreshing happens when the app is opened and at regular intervals.

The **type widget** goes one step further: a type button **starts speech recognition immediately** and creates the booking directly, without opening the app (only the system voice dialog appears). The grey **switch button** cycles through the chosen account and its places; the balance and the target of the next booking follow that selection.

5. Symbol and control reference

This overview explains every symbol in the app and what it does.

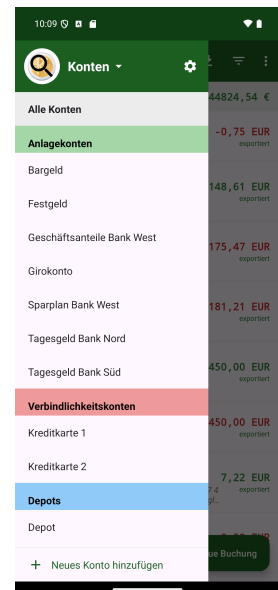

Symbol	Name	Meaning / function
≡	Menu / account drawer	Top left. Opens the side drawer with all accounts, portfolios and „Add account“.
←	Back	Top left on sub-screens. Returns to the previous screen.
↓	Export / synchronize	Title-bar symbol (down arrow, download style). Starts the sync: writes new bookings into the .kmy or uploads them to the sync target.
▽	Filter	Funnel symbol. Opens the filter by payee, category and amount.
▦	Analysis	Bar-chart symbol. Opens the graphical analysis.
⋮	More items	Three dots (overflow). Contains „Categories“, „Holdings“, „Budget“, „Scheduled“ and – at the very bottom – „Settings“.
+	New booking	Round button at the bottom right. Short tap: record a booking. Long press: voice input.
⊕	Silent amount entry	Keypad symbol (only when location is enabled). Type just the amount; the payee is resolved via your location.
↑	To top	Small arrow. Jumps to the top of the booking list.
★	Preferred alias	Marks a preferred alias in the alias list (considered before bookings).
→	Alias mapping	In the alias list: „spoken term → correct payee“.
→ / ←	Transfer	In the booking list: → outgoing, ← incoming transfer (shows the counter-account/payee).
Split	Split booking	Marks a booking that is split across several categories.
exported	Exported	Small green hint: this booking has already been exported.
● red/ green	Amount colour	Red amount = expense/negative, green amount = income/positive.

Note: the title-bar symbols come from the Material Design set; their meaning is described above. Depending on space, some items appear in the „⋮“ overflow menu.

6. Accounts and the account drawer

The account drawer is the list of your accounts. ☰ at the top left opens it; a tap on an account shows its bookings, a long press fetches it afresh from KMyMoney. Day to day that is all you need. The rest of this chapter explains how to group, search and sort accounts.

- Open it via the ☰ symbol at the top left, or by swiping in from the left edge.
- **„All accounts“** shows all bookings together; a single account filters the list to it.
- **Long press on an account:** import/update that account from the .kmy.
- **Long press on „All accounts“** – or pull down in that view: reloads **everything** (accounts, portfolios and scheduled transactions) in one pass.
- **Portfolios** sit at the bottom under the „Portfolios“ heading and behave just like accounts: a short tap opens the portfolio view (the selected portfolio stays highlighted), a long press updates it.
- **„Add account“** (at the bottom): loads the .kmy and offers the contained accounts for selection.

Account drawer with accounts, portfolio and „Add account“

Account groups

Besides the **account kind** (asset, liability, portfolio) there are **account groups** for your own ordering – „Favourites“, „Joint“ or „Savings“, say. An account may sit in any number of groups; the grouping by account kind is unaffected.

Choosing a group

Tapping the „Accounts“ heading drops the groups down as a list; the one in force carries a **tick**. The drawer then lists only its accounts, and the top row carries the group name instead of „All accounts“.

The choice applies **app-wide**: the booking list, the balance bar and the holdings view all follow it. In the balance bar the group appears as an additional first page; „Total“ still means all accounts.

Where the groups come from

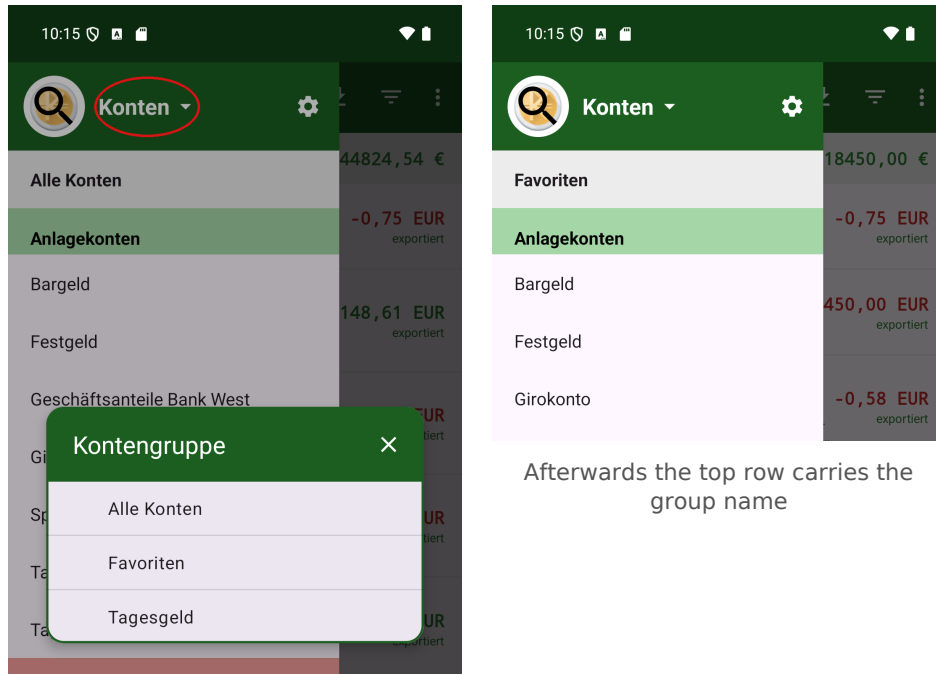

Each row carries the mark of its origin: a **folder** for groups you created, a **bank building** for those from the institutions block of the .kmy (e.g. „Volksbank“), a **star** for the „Favourites“. The latter two merely mirror the file – only the import writes them, they cannot be edited by hand.

The **„Favourites“** come from the accounts marked as preferred in KMyMoney (its account dialog, „Preferred account“). They sit at the very top of the picker, are rebuilt on every import, and their name follows the language of the app.

When a group disappears

Removing the **last account** from a group (or deleting that account) makes it disappear without asking – there are no empty groups. That is also how you get rid of a group again. Once no account is preferred any longer, the „Favourites“ likewise disappear.

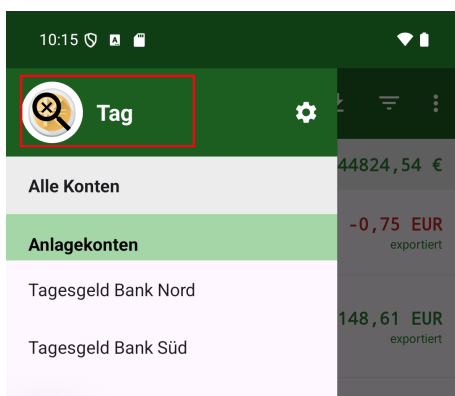

Groups holding nothing but **closed** accounts no longer show up in this picker. They stay selectable in an account's „:“ menu so they can be revived.

Tapping „Accounts“ opens the group selection

Afterwards the top row carries the group name

Searching accounts

The search field takes the place of the „Accounts“ heading

A **magnifier** sits on the kMyMoney emblem at the top of the drawer. Tapping it opens the keyboard, and for the duration of the search your input takes the place of the „Accounts“ heading. What you type filters the account list instantly by part of the name – „kasse“ thus also finds „Sparkasse“ and „Barkasse“.

Closing the keyboard puts the heading back in its place – but the term **stays in effect**, so the list still shows only the matches. The magnifier now carries a small cross to signal that a filter is on; tapping it lifts the search.

The search stays inside the chosen account group and is never stored. It also ends by itself as soon as you pick an account, close the drawer or leave the app.

Sorting and managing accounts

The **gear icon** next to „Accounts“ opens a view of its own. Unlike the drawer it also shows **closed accounts**, in grey, each with its balance on the right.

Changing the order

Drag the handle to sort accounts within their account kind. The order applies everywhere accounts are listed – including the pickers while recording a booking. Drag a **whole account kind** and its accounts collapse for the duration of the drag, leaving only their number; that way even a large block reaches its place in a few movements.

Putting an account into a group

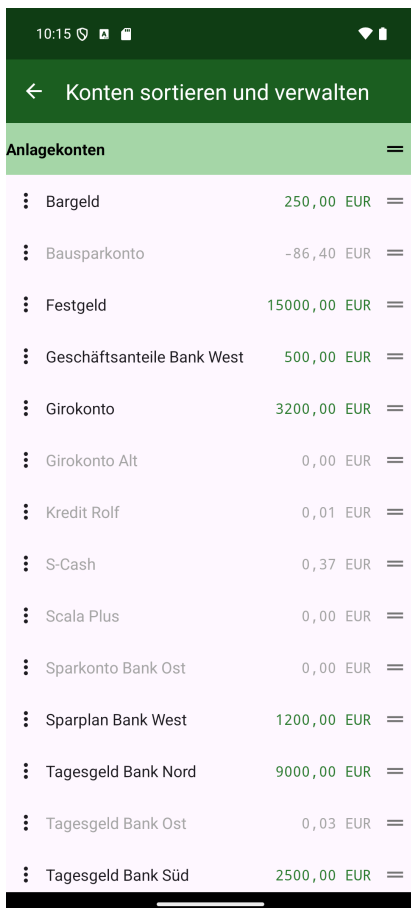

The „:“ on an account row opens your own account groups as a **tick list**. The tick says whether the account sits in that group; set and clear as many as you like, nothing is written until „OK“. On top there is a free field for a **new group** – typing into it ticks its box by itself.

Closing and reopening an account

The same tick list carries, next to „OK“, a „**Close account**“ (or „Reopen account“) button; it applies the ticks along the way. Closing is offered only at a **balance of 0**. If a closed account regains a balance on import, it reopens by itself.

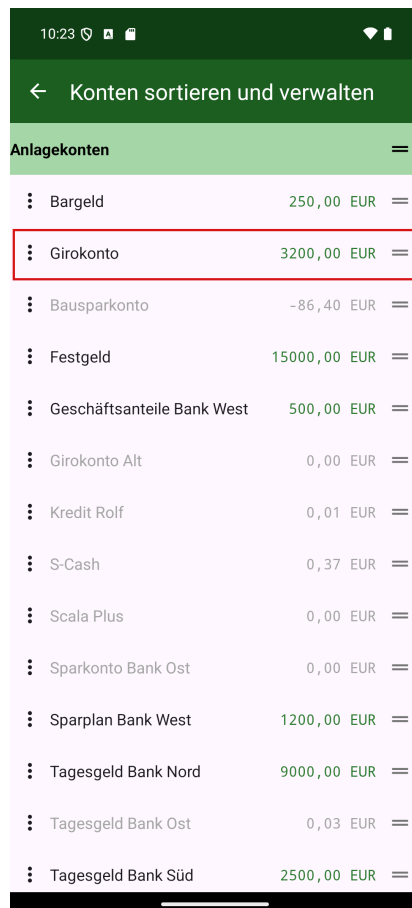

Special case: groups from the .kmy

Banks and favourites are not in the tick list. Type one of their names into the free field and the dialog stays open with a note, writing nothing – an assignment by hand would be gone again at the next import anyway.

7. Recording a booking

Tap the round **+** button. The booking editor opens. An ordinary expense is recorded in four steps:

1. Type the **amount**.
2. Pick the **payee** or type a new one.
3. Pick the **category** – usually it is already there.
4. „**Save as new**“.

Account, date and place are pre-filled and need attention only if something else should apply. The rest of this chapter explains the fields one by one.

Picking a value - the same everywhere

Payee, account, category and **place** fields are display, list and search box in one – in the booking editor just as in transfers, reconciliation, the filters, the alias editor, the settings and the analysis.

- **Entering the field:** the current entry steps aside and stays on only faintly; the full list opens.
- **Deleting characters:** the list widens again. Empty the field and everything is back.

Booking editor with type switch, amount, payee and account

- **Typing:** the list narrows as you go. Matches are found anywhere in the name and regardless of case – "kasse" finds "Sparkasse".
- **Tapping an item:** it goes into the field and the keyboard closes.
- **The Done key** (bottom right on the keyboard): finishes the entry and closes the keyboard without you leaving the field. If typing leaves exactly **one** match, it is taken – "visa u" is enough for "Visa Urlaub". With several matches the same rule applies as when leaving the field.
- **Leaving without a choice:** the previous entry returns.

A **new payee** may be created this way: type a name that does not exist yet and it stays.

Account, category and place have to come from the list – an invented name is replaced by the previous one when you leave the field. New accounts arrive through the import, new places are created in the settings.

Account fields put what you are most likely to need at the top: first your **favourites** (star), then the accounts of the currently selected **account group** (the group's own icon), then all the rest with the icon of their account kind. Your own account order is kept within each block.

What the app fills in for you

Nearby payees first

The **six nearest payees** head the payee list with a **bearing arrow**, the nearest one first. Below them the complete alphabetical list follows unchanged – so those six appear a second time. **As soon as you start typing** this block disappears; delete what you typed and it is back.

Distances are measured from the **booking's location**, that is from whatever the **location** row shows: in a new booking your current one (only with **location (GPS)** switched on), while editing the booking's stored mark. If you pick another point there via „**Map**“, the block follows.

The distance comes from the same sources as the radius filter: the coordinates in the notes of a payee's bookings and the learned locations of its aliases. The nearest point counts; anything beyond **10 km** does not appear.

No block appears when the booking carries no mark – where you stand today says nothing about an old booking. It does not appear when you view a planned booking either.

The category follows the payee

Once the payee is set, the app fills in the matching category. It searches in this order, always for the selected booking type: first the **preferred aliases** (★), then your **bookings** for that payee (the most recent first, the parts of a split booking count too), finally the **remaining aliases**. The first find goes into the first category row, and the partial amount jumps to the total.

The other finds – up to six – head the picker under the heading „**FOR THIS PAYEE**“, and they do so in **every** category row, so splitting benefits too. As soon as you start typing, that block disappears and the categories only appear in their usual place under „EXPENSE“ or „INCOME“.

When the preset keeps up: as long as you have not touched the category rows yourself. Change the payee and the category moves along – a second row from an alias gives way to the new payee's category as well. Switch between expense and income and both block and preset switch with it.

When it stays put: as soon as you have done something in the category rows yourself – picked or typed a category, changed a partial amount, removed a row. From then on nothing is pulled in any more. When **editing** a saved booking or booking a scheduled one the category is left alone anyway, even if you change the payee there. Transfers have no categories.

The amount can guess the payee (off by default)

The other way round, the amount can supply the payee. Leave the amount field, and if within **100 m** of the location mark there is exactly **one** payee whose usual amounts match it, that name goes into the **empty** payee field – bringing its category along. This applies to every booking type; for transfers it is compared against the amounts of your previous transfers to that payee.

If several match, or none, nothing happens; a payee you entered yourself is never touched. The suggestion list itself is unaffected – it still lists every payee within 10 km. Switch the pre-fill on under „**Use amount for payee suggestions**“ in the settings.

Arithmetic in the amount field

The **amount field** accepts a small **calculation** instead of the system keyboard (e.g. $10+20*3$ or $30-5$) – handy when splitting a bill or offsetting several items.

Fields and controls

- **Type switch:** **Expense** · **Transfer** · **Income**. Sets the kind of booking.
- **Amount, payee, account** (chosen from existing accounts).
- **Date:** pre-filled with today; the „**Today**“ button quickly sets the current date.
- **Note:** free text. With location enabled it automatically contains „GPS: lat, lon“.
- **Place** (only for expenses/income created in the app): which cash place the booking is credited to.
- **„Exported“ toggle:** marks whether the booking has already been exported.

Saving

- **Save as new:** creates a new booking.
- **Update:** saves changes to an existing booking.
- **Delete:** removes the booking.

Date prompt when copying: if you open an existing booking, leave the date unchanged and „save as new“, the app asks whether the old date or today should apply.

Split booking (several categories)

In the „Split categories“ section you can enter several categories with partial amounts. With one category the total and category amount are linked; with several, the sum must equal the total. Partial amounts may be negative.

Choose the type „Transfer“, then the From and To accounts plus an optional payee. This creates a linked booking in both accounts (marked → or ← in the list). You can also choose a **from-place** and a **to-place**; then the respective place journal is updated (from-account –amount, to-account +amount). Both fields are preset with the **default place** of the respective account; „no place“ leaves that side's journal untouched. Editing or deleting the transfer rolls the place movements back.

Tags

KMyMoney has **tags**: freely maintained keywords such as „Holiday“, „Business trip“ or „Tax“, any number of which a booking may carry. The app reads them when syncing with the KMyMoney file and writes them back on export – including when you change a booking that has already been transferred. Below the note field there is a „**Tags**“ row for them: it names the tags, and once there are too many for one line, only their number.

The **pencil symbol** opens a small window listing every tag of this booking, each with its own delete cross; below it a field adds another one. It behaves like the category, account and payee fields – typing shows the matches, tapping one takes it. **Only what already exists in KMyMoney can be entered**: the app never invents a tag, an unknown name is discarded when you leave the field. The **bin symbol** on the row clears all tags of the booking in one go. None of this takes effect until you save the booking; leave the screen without saving and everything stays as it was.

Tags work the same for **expenses, income and transfers**; on a transfer both account sides carry the same ones, since in the KMyMoney file it is a single booking. On a **scheduled booking** the rule's tags can only be viewed, not changed – book it and they come along and can then be edited. If the app does not know **any** tags yet – before the first sync, say, or in CSV mode where there is no KMyMoney file – the whole row does not appear at all.

8. Recording quickly: voice, location, receipts

This chapter gathers the ways a booking comes about in a few moves: **speaking** it, typing the **amount** alone and letting the location guess the payee, attaching a **receipt**, and teaching the app a mapping as an **alias**.

Voice input

A **long press** on the **+** button opens voice input. Say e.g. „barber 20 €“: the app looks for a matching template (payee, account, category, booking type) and opens it with today's date and the spoken amount. Payee search also finds similarly spelled names.

Nearest payee

If there are several payees with the same name (e.g. „REWE location 1“ and „REWE location 2“) and the location is known, the app picks the **geographically nearest** one – both for existing bookings and for aliases with stored coordinates.

Amount-only entry (keypad 田)

With location enabled, the keypad symbol appears at the bottom. Type just an amount: the app looks for a matching template at your current location – among the payees of the accounts on display – and shows the resolved payee before you even save.

Several payees at the same place

Where several known payees share your location (petrol station and car wash, supermarket and bakery), the **amount** decides as well. Before you type, the field below states how many come into question; while you type, the name matching the amount appears: €8 is the car wash, €80 the petrol station.

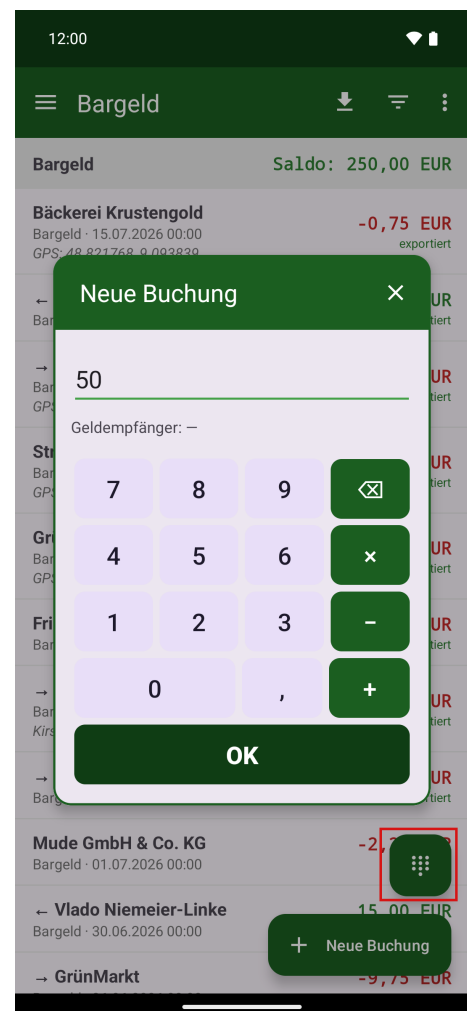

Tap the name to cycle through the remaining candidates and finally through „no payee“ – then you fill it in later yourself. Whatever is shown when you confirm is what gets booked.

How the order comes about

Usual means the range holding nine out of ten of that payee's previous bookings. **Nobody is ruled out** – the amount only sets the order, you can always cycle through them all.

Who comes into question at all

If the amount fits none of the ranges, the one closest to it comes first. It is measured as a **ratio**, so that a payee with small amounts does not always lose against one with large ones: at €15 the range €20–100 beats the range €5–10, at €1 it is the other way round. Anyone with fewer than five bookings is not judged at all and falls in the middle.

Amount-only entry: the payee is resolved via the current location

The same order decides when you **only speak an amount** – on the phone as from the watch; there the first one is taken without asking.

Only payees of the **accounts on display**. Once you pick an account in the drawer (or an account group), anyone who so far has only been booked on another account stays out – even standing right next to them. An alias without an account of its own counts everywhere; on the watch the account picked there with the grey key applies.

If only **one** payee is nearby, it appears even with an unusual amount – filling the tank once is no reason to leave the booking blank.

For the amount to have a say here at all, the **„Use amount for payee suggestions“** switch must be on (**off** by default). Without it the nearest payee appears at once and stays put while you type – you then choose by tapping alone.

Receipt photos

While editing, each page gets its own row with crop and delete

In the booking editor the **„Receipt“** button lets you **take a photo** of the receipt or **pick one from the gallery** (one photo per booking; can be turned off under *Settings* → *Receipt photos*). The image is stored privately on the phone and uploaded **in the background** to a „Belege“ folder – with a sub-folder per year – inside your configured sync folder (WebDAV/Nextcloud or SMB); photos taken offline upload on the next app start with a connection. This works for **every booking type**, transfers included – the bank statement for a wire, say. As both sides of a transfer carry the same note, **both accounts** show the same receipt; you can attach and change it from either side.

A booking can hold **several pages** – for the second half of a till roll or an invoice spanning multiple sheets. The camera icon in the receipt row **appends another page** every time; while editing, each page gets its own line with crop and delete. When merely **viewing** a booking one line is enough: the page count on the left, a single image icon on the right that opens the viewer.

The reference to the image is stored in the note as a **„BELEG: ...“** tag, just like the GPS coordinates. Because the note survives export/import with KMyMoney, the app finds the photo again **even after a re-import**. In the editor the note field shows only your free text; **GPS and the receipt appear as two separate read-only rows below it**, each with an icon – the map icon opens the location, the receipt icon opens the photo (view) or the camera/gallery chooser (edit).

Instead of a photo you may attach a **PDF document** – the invoice you downloaded, a bank statement, the confirmation of a transfer. The receipt dialog offers **„Choose PDF document“** for it and opens the device's file picker. Several documents per booking are possible; each gets its own line with a PDF icon. Tapping it opens the document in your device's **usual PDF viewer**, with all its pages; a PDF is never cropped, only attached or deleted. A booking carries **either** photos **or** documents – the other entry in the dialog stays dimmed until you have deleted the existing pages. A PDF is uploaded just like a photo, into the same year folder; the note records it as **„BELEG (PDF): ...“**.

The **viewer** is part of the app itself. **Swiping** pages through the receipt (the header counts along: „Page 2 of 3“), **pinching** and a **double tap** zoom in to read the small print; another double tap fits the image back in.

The images are uploaded into a „**Belege**“ folder with one subfolder per year. It sits **next to the KMyMoney file** (in CSV mode inside the configured sync folder) – the same place the „Backup“ folder appears in. The year folder follows the **booking date**; move a booking across new year and its images follow on the server. After switching phones the app fetches each receipt from there when you open the booking.

Delete a booking and its images disappear on the **next app start** – not right away, so that the „Undo“ offered straight after deleting still brings the receipt back.

The built-in viewer counts along: „Page 2 of 3“

When a receipt is not yet on the phone, opening it shows „**Loading - please wait**“ while the app fetches it in the background; the phone stays usable. Only when there is **no connection** does the message „No connection – receipt cannot be loaded“ appear; while a connection exists the app keeps waiting patiently. If the receipt cannot be found despite a connection – because the file is missing on the server, say – the app finally asks whether to **remove the orphaned reference from the booking**; confirm and it is deleted right away, marking an already-exported booking as „edited“.

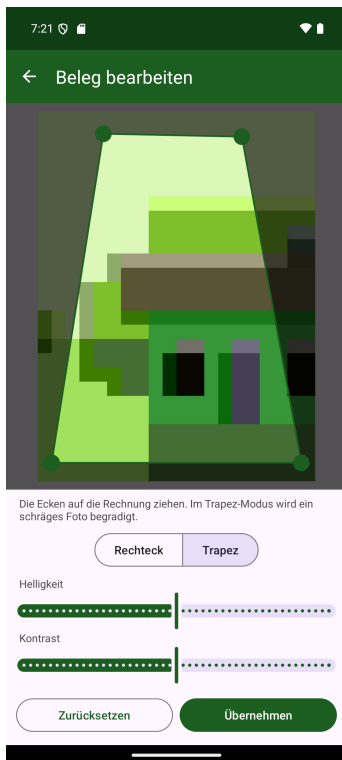

Exporting the receipts of a filter

Inside the app receipt files are named after an identifier – enough for the app, useless for a human. Anyone handing a quarter's receipts to their accountant needs speaking names. That is what „**Export receipts**“ in the menu (:) of the booking list is for. The entry only appears **when a filter is set**, because it refers to exactly that filtered selection: date range, payee, category, tag, amount – whatever you have chosen.

The app packs all receipts of those bookings into a **ZIP file** and then asks where to save it. Every file inside is named „**date_payee_amount_bookingnumber_page**“, for example „2026-08-16_Bäckerei-Mayer_8_23_1487_p1.jpg“. The date comes first so that the file manager sorts correctly by itself; the booking number makes sure that two purchases on the same day at the same shop for the same amount do not end up with the same name. Multi-page receipts keep their page count, PDF receipts their extension. For a **transfer** the shared receipt is packed only once, named after the outgoing side.

Receipts that are not on this device are fetched from the sync folder while packing – after switching phones that is the normal case. If that fails (no network, file not there), the app packs the rest anyway and tells you at the end **how many** were missing. If none of the filtered bookings has a receipt, you only get a short note and are not even asked for a location; if **not a single** receipt could be fetched, no empty file is created either.

Cropping and straightening receipt photos

Editing: four corner points,
„Rectangle“/„Trapezoid“,
brightness and contrast

Right after the shot the app asks whether you want to **edit** the image. **„Keep as is“** leaves the photo untouched – so you never have to bother. Later you can reopen the editor at any time via the **crop icon** in the receipt row.

In the editor you drag the **four corners** onto the bill. There are two modes: **„Rectangle“** cuts straight, leaving just a section of the image; **„Trapezoid“** lets you place each corner freely and then **straightens** a skewed photo into a clean rectangle. Two sliders adjust **brightness** and **contrast** – handy for faded till receipts. The preview follows every change immediately, and **„Reset“** restores the starting state.

The **untouched original** is not lost: on „Apply“ the app keeps a separate file carrying **„_original“** in its name and uploads it as well. That backup stays **for good** – even after several rounds of editing the starting image is still there. Deleting the receipt removes the original too.

So when you edit an image **a second time**, the app asks: **„Continue editing“** works on the current version – handy to nudge the brightness without losing your crop. **„Start from original“** brings back the untouched photo when a crop turned out too tight. For an image never edited before, the question does not appear.

Alias names (learned mappings)

If you change the recognized payee while saving, the app asks whether to remember the mapping as an alias – together with account, category and **place** (for transfers the from/to accounts and from/to places). So „mom 100 €“ is later booked automatically to the real name with the right account/place. The category and place fields in the alias form behave like the booking editor (grouped category picker; a place field only for accounts that have places). Resolution order: **preferred aliases (★) → bookings → remaining aliases**.

An alias can hold **any number of locations** (e.g. several branches). In the alias form, „Add coordinate“ adds a row with latitude/longitude and „Open map“; the minus button removes a coordinate. When resolving (amount-only/voice) the alias matches if the current location is near **any** of its coordinates. Re-learning an alias from a booking at another place **appends** the coordinate (it does not overwrite).

The slider belongs to the **booking type** selected above: switch to income or transfer and it shows the amounts of that type. For transfers only the outgoing side counts – otherwise every amount would appear twice.

Managing alias names: spoken term
→ real payee

Below that sits „**Usual amounts**“: a two-handled slider defining which amounts are typical for this payee – the **amount filter** used when several payees share a location. Narrow it, and this payee only wins on very typical amounts; widen it to 0–100 %, and every amount it ever had counts.

The slider does not move in amounts but in **ranks**: the default 10–90 % drops a tenth of the previous bookings at each end, so a single outlier cannot stretch the range. The corresponding amounts are shown above and on the handle. With fewer than five bookings the slider is greyed out – that few say nothing yet.

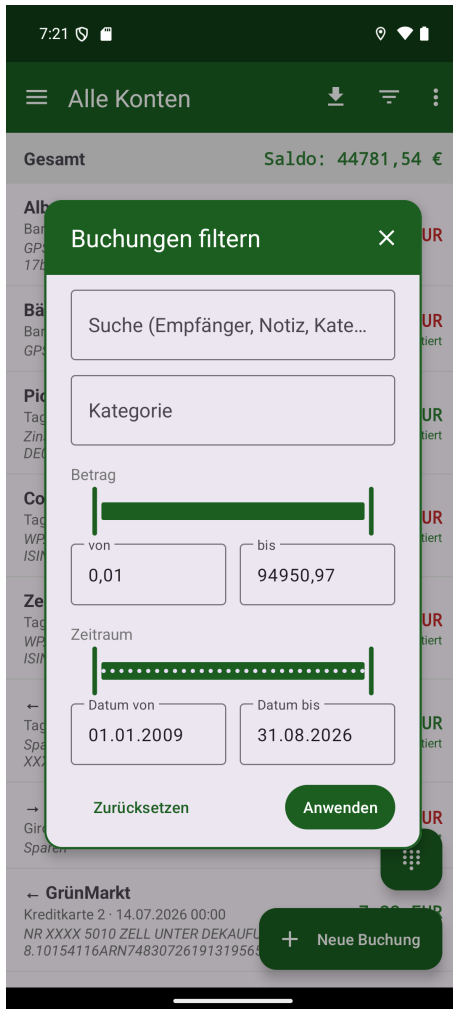

The range always applies when only an amount was spoken; in the number pad and the booking editor it takes the „**Use amount for payee suggestions**“ switch.

An alias also carries **tags**: the „Tags“ row opens the same window as in the booking screen via the pencil, the bin clears them all. Create a **new** booking for that payee afterwards and they are there right away – just like the category. Nothing is overwritten: an existing booking you open and a scheduled one keep their own tags. If the app does not know any tags yet (CSV mode, or before the first sync), the row does not appear at all.

Independently of that, the app remembers which tags have **already been used** with a payee. They sit at the **top** of the tag window, marked with the tag symbol, and again at their alphabetical place – the same make as the „For this payee“ block of the category picker. The

ranking is the same too: **preferred aliases (★) → bookings (most recent first) → remaining aliases**, at most six. As soon as you type, only the matches remain.

9. Booking list and filter

Filter by search text, category, amount and period

- **Short tap** on a booking opens it as a read-only view: a large coloured heading shows the type (income = green, transfer = yellow, expense = red), and the balance before and after the booking is shown at the bottom.
- **Long press** opens it for editing.
- **Pulling down** re-reads the file in the kmy variant and refreshes exactly this account or portfolio. In the CSV variant this goes through the account drawer (long-press the account).
- **Markers** on a row: „Split“, → / ← for a transfer, „exported“; the colours red and green stand for expense and income.
- The **note** is truncated to two lines in the list; in the editor the field spans four.
- **Undo**: after deleting a booking, „Undo“ appears briefly at the bottom – one tap recreates it. In the place journal the deletion and the recreation stay visible as movements. Transfers have no undo.
- **Long press on the app icon** (home screen): „New booking“ opens the editor directly.

The filter (funnel ▾)

The funnel in the title bar narrows the list. At the top sits a **search field** that searches **payee, note and category** at once – anywhere in the word and regardless of case. That way you can find a booking by its note as well. Below it follow category (as a tree), **tag**, amount and **date from-to**.

The filter applies to the list and the analysis. With one set, the ☰ menu also offers „**Export receipts**“, which writes the receipts of exactly that selection into a ZIP file.

Amount and period

For the **amount**, expenses count negative and income positive; the slider runs from the largest expense on the left to the largest income on the right, with a thin mark showing the zero in between. It moves in **shares**, not in amounts: the right thumb at 90 % cuts off the largest tenth – so a single outlier no longer stretches the whole slider. For an exact bound, type it into the field.

The **date** runs as a slider in whole-month steps; type an exact day into the field.

Radius (only with location)

At the bottom – only with **location (GPS)** switched on – sits the **Radius** button. Each tap steps through „off“, 100 m, 500 m, 1 km, 10 km and back to „off“. On a step only those bookings remain that were made within that radius of where you are now.

Where a booking's location comes from: the coordinates in its note, and where those are missing, the learned location of the payee in the alias. Your own position is captured **once** when you apply – so the list does not travel with you as you move on.

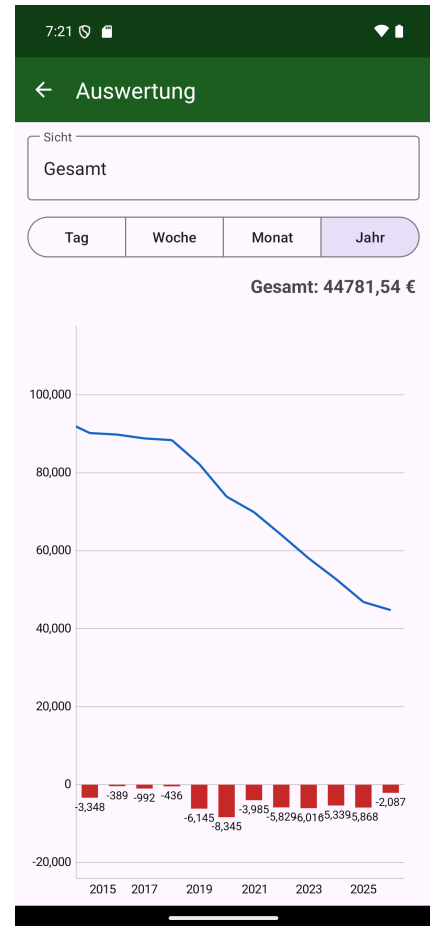

If no position is known yet the list stays empty and the title line shows „Filter active (0)“. „**Reset**“ restores „Radius off“; after that location no longer matters. Unlike the other criteria the radius applies to the list only, not to the analysis.

Special cases

The **tag** is only present when the app knows tags from the KMyMoney file; „All“ clears the choice again. And with a **category** filter set, a split booking shows only the partial amount of that category.

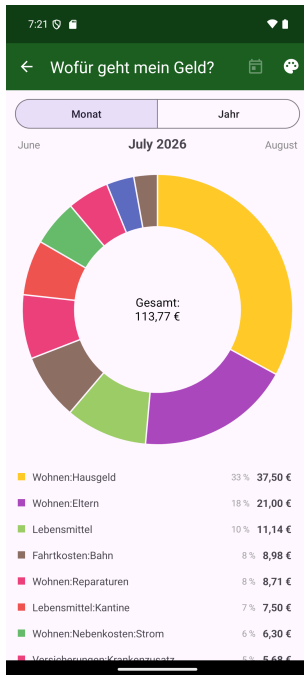

10. Analysis

- Periods: day / week / month / year.
- Views: single account, place or total.
- With an **account group** selected in the drawer, it appears as its own view behind „Total“ and „Total without portfolio“: only the accounts of that group, its portfolios included – the same figure as in the balance bar on the main page.
- **Zoom by gesture**: horizontal = number of bars, vertical = Y axis.
- Closed accounts count only in the total view (historical balance).

Analysis as a bar and line chart

11. Where does my money go?

Category pie chart:
„Where does my
money go?“

The **Categories** page (menu : → **Categories**) shows the **expenses per category** – as a pie chart and below it as a list, sorted **descending** by amount. It complements the analysis (chapter 9), which only shows the development over time per account/place.

- **Month/Year** toggle: current month resp. current year.
- In both views you page through the periods by **swiping** – just like in the budget (right = back, left = forward); the header shows the displayed month resp. year centred and bold, with the previous and next one in grey to the left and right (tapping pages as well). Paging stops before the first booking period and after the current one.
- The chart uses the **full width** and at most **half the screen height**; the list below scrolls on its own while the chart stays visible.
- The slices are unlabelled; a **tap** shows category and amount in the centre, without a selection the total is shown there. The list additionally states the **share in percent**.
- The analysis covers **all accounts** and lists only categories with expenses.

- **Split transactions** count through their partial amounts (not twice), **transfers** are left out – the same data source as the budget page.

Include scheduled transactions (calendar icon)

The **calendar toggle** at the top right adds the **scheduled expenses due** in the period (chapter 12) to the ones already made – including those that sit as a **deduction inside a scheduled income**, such as the capital gains tax on a dividend. Then:

- The **sum per category** grows by the scheduled share; the list sorts by the new sum.
- In the chart the **already paid** share appears in the category's strong colour, the **scheduled** share right next to it in the **same, lighter** shade – together they form **one continuous sector**.
- Rows with a scheduled share can be **expanded** (arrow on the right), showing „Already paid“ and „Scheduled“ separately.
- With the toggle on, the slider also pages into **future** months/years – which then show only scheduled values – up to the last scheduled occurrence.

Set colours (palette icon)

Each category has a **fixed colour** – regardless of its current position in the list. The **palette icon** at the top right opens the colour list: tapping a category opens the picker; „Default“ restores the automatic colour. The assignment takes effect immediately in the chart and list.

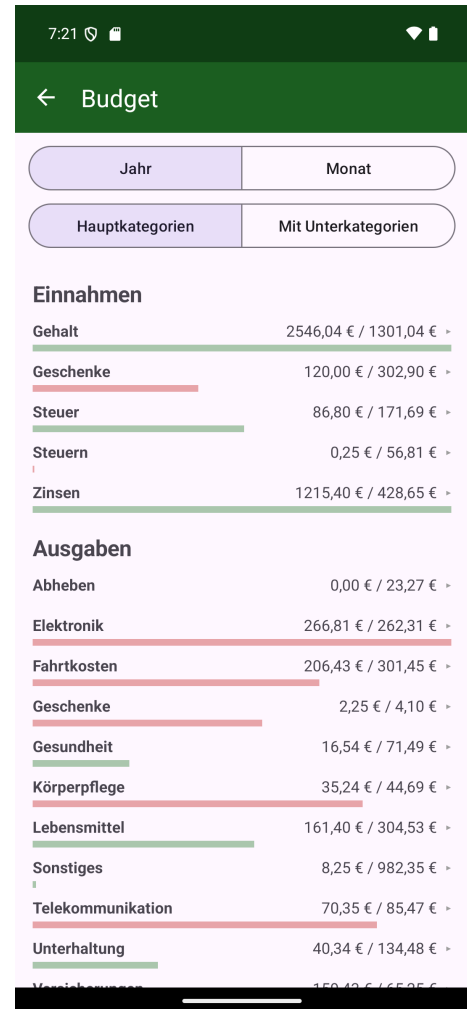

12. Budget

The **Budget** page (menu **☰** → **Budget**) puts the **actual** value against a per-category **target**. It answers the question: „Am I on plan?“

Where does the target come from?

- **Import from KMyMoney** (a button in the settings): if your .kmy contains a budget, its values are taken as the target — **month-accurate** (monthly and month-by-month budgets are stored per month). Such targets are **not editable**.
- **Compute from history**: sum of all previous years ÷ number of years with data. Automatic when the „compute budget internally“ switch is on, otherwise via a button. These targets can be edited by a **long press on a row**.

Whether a category is **income or expense** follows from the .kmy file. A refund therefore reduces the expense category without turning it into income; a computed negative actual is clamped to 0.

Budget page: actual/target per category, with progress bars

Display

- Toggle **year / month**. The year view sums the months; the month view shows the displayed month's target against that same month's actuals. In month view you page through months with a **swipe** (or by tapping the grey previous/next month in the header).
- Toggle **main categories only / with subcategories** (a main category sums its subcategories).
- **Income** first, then **expenses** (large headers); main categories bold, subcategories indented. The right side shows „actual / target“.
- Under each category a slim **bar**: **green** when on plan, **red** when behind. Its width shows the share of the target used.

When the bar turns green

Instead of a purely linear time comparison, the app learns each category's typical timing from the **payment history**. A **one-time** expense – a transit pass bought at the start of the month, say – is green as soon as it is within budget. **Regular** expenses such as groceries are still measured against the elapsed time. Without history the linear comparison applies; for income it is reversed.

13. Scheduled transactions

Geplante Buchungen		Überschuss	2.631,01 EUR

03.08.26	Sparen Sparplan Bank West Frau Sabine Rosemann	4,50 EUR	

The **Scheduled transactions** page (menu : → **Scheduled transactions**, shown only in **.kmy mode**) imports the standing orders / schedules set up in KMyMoney and shows them as **one chronological list** by due date. The schedules are **not** refreshed by the normal account import; they update only when you use the **pull-to-refresh** gesture on this page – with the familiar **yellow progress banner**.

- **Short tap** on a row: view the schedule – in the familiar detail view, read-only, including the categories of a split transaction and the balance before and after.
- **Long press**: book it now. Just like in the booking list.

Scheduled transactions:
chronological list with
balance strip

What the list shows

A coloured **strip** precedes each row: green for a deposit, red for a payment, yellow for a transfer. At the front the **date** in a column of its own, next to it the **name** with the payee in smaller grey text behind it, below it the **category** (with several, „Split transaction“), then an **account column** and the amount on the right. For a transfer the account column shows both accounts one below the other instead of a category.

Each recurring schedule is **expanded into its individual occurrences** – a weekly bakery therefore appears several times – from the stored next due date up to **two years** ahead. Only **active** schedules are included; entries without a date are skipped, and an end date (or a limited number of payments in KMyMoney) limits the preview.

The **type** comes from KMyMoney. A stock or ETF purchase from a savings plan is a **transfer** there, from the cash account into the security – not an expense.

Booking or skipping a schedule

A **long press** on a row opens the booking editor as a **new booking**, prefilled from the schedule: date equals due date, plus amount, payee, account and categories or from and to. Check it, adjust if needed and save with „New booking“ – it lands in the account and, with a place chosen, in the holdings.

The same editor offers a **„Skip booking“** button (with a confirmation): no transaction is created, but the date still counts as done.

The schedule moves on. Booked or skipped, the date disappears from the list right away, and on the next .kmy export the KMyMoney schedule is moved on by **one period**; for an

actual booking the date of the last payment is written as well. The schedule itself – amount, rhythm, splits, start date – stays unchanged, and so do later dates. Cancelling the editor leaves the schedule as it is.

Reminder for due transactions

If you want, the app reports once a day when something is due **today** („3 scheduled transactions due today“); tapping the notification opens this page. The switch „**Remind me of due transactions**“ is in the settings and is **off by default**; when switching it on the app asks once for the notification permission. If nothing is due, no notification appears.

Balance strip (cycling)

At the top – like in the normal account view – a **balance strip** (label on the left, amount on the right) that always reflects the **currently set filter**. Each **tap** cycles the display:

- **Surplus** or **deficit** (default) = total deposits – total bills; only the applicable state is shown (green = surplus, red = deficit).
- **Total deposits** (green).
- **Total bills** (red).
- **Transfers** (yellow) = sum of all scheduled transfers.

Transfers count towards **neither** deposits nor bills (they only move money between your own accounts) and therefore have their own line.

Filter

The **filter icon** at the top right narrows the list (and thus also the balance strip and the chart) by:

- **Type**: deposits, bills, transfers (each can be toggled on/off).
- **Account**: single selection from a list of all accounts (or „All accounts“).
- **Name**: search text matched against **name or payee**.
- **Period**: slider (month granularity) or direct, day-precise date entry.

Chart

The **chart icon** at the top right opens an analysis that **looks exactly like the account view's chart**: green/red **bars** for deposits and bills and a **development line** of the selected account or of total wealth. You can pick the **view** (total or a single account) and the **time unit** day/week/month. The line starts at the far left at **today with 0** and runs to the right into the future; like the account chart it can be **zoomed and panned**. The chart inherits the list filter. For a **transfer** the amount decreases on the **source account** (red) and increases on the **target account** (green) – the direction („pay to“ or „from“) is taken from KMyMoney.

When you scroll far down, the **scroll-to-top button** (bottom left) jumps straight back to the start of the list.

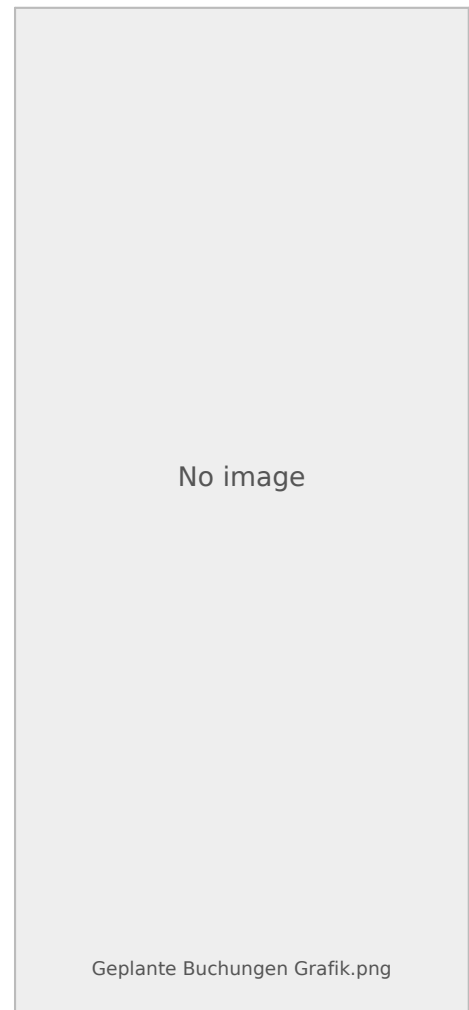

Chart of the plans: bars per due date and a development line

14. Holdings (places) and portfolio

Holdings / places - what are they?

01:21

Holdings: asset/liability accounts and portfolio, with places per account

A **place** describes **where** an account's cash physically is – e.g. wallet, jar, petty cash or an envelope. An account „Cash“ can thus be split into several real storage locations. **This feature does not exist in KMyMoney**; it is an addition of this app for everyday cash handling.

Places are **not limited to cash accounts** – they can be used for **any account**. In the following examples we stay with cash, though.

Reached via **☰ → Holdings**. Each place keeps its own **movement journal**; its balance is the sum of its movements. The sum of all place balances always equals the account balance: **„no place“** is the automatically computed remainder (account balance – sum of the other places). So the account stays consistent no matter how many places you create.

- A booking created in the app automatically produces a movement on the account's **default place**.
- Place movements can be **created, edited and deleted** individually.
- Money can be **transferred between places** (e.g. to assign an imported booking to a place, or to move cash from the envelope into the wallet).
- Later amount or deletion changes append dated balancing movements – the history is preserved.

Place on old (imported) transactions

A transaction that was **exported and imported again** loses its place link – that is intended. If you still open such a transaction **for editing** (long press), the **place field is shown** as soon as the account has any places, so you can pick one. What happens then depends on the button you press:

- **„New transaction“** (duplicate): a **new** transaction is created – the chosen place **is saved** and a movement is added in the holdings. This is the way to give an old transaction a place afterwards.
- **„Update transaction“** on a transaction that had **no place before** and is **already exported**: the entered place is **ignored**, the place journal stays untouched.
- **„Update transaction“** on a transaction that **had a place before**: the new place **is saved** and followed up with balancing movements (old place –amount, new place +amount).

In the plain **view** (short tap) the place field only shows up if the transaction really **sits at a place** – a „no place“ would tell you nothing, and an imported transaction has none at all. For **transfers** that holds for the from-place and the to-place **each on its own**; the movement is created on **both accounts**.

Cash count at place level

A particular advantage: the **cash count** (reconciliation) can be done **per place**. You count only the cash of *one* place – say the wallet – enter the counted amount, and the app automatically books the difference as a balancing movement. So you don't have to reconcile the whole account at once; this **simplifies reconciliation considerably**. Imported bookings carry no place link. If an account has **no places at all**, the place field is missing and the whole account is reconciled.

Next to the „**Create booking**“ switch there is a button for the **payee and category** of that balancing booking. Both are empty at first and the button reads „Set payee/category“; as long as nothing is set, „**Apply**“ stays greyed out. The button opens a small dialog with both fields (with the same suggestion lists as in the editor); „**Save**“ keeps them permanently, so the next cash count already has them prefilled.

Asset and liability accounts

Accounts are grouped by their KMyMoney type into **asset accounts**, **liability accounts** (loans, credit cards) and **portfolios** – with colour-coded section headers (assets green, liabilities red, portfolios blue; light theme → lighter colour/black text, dark theme → darker colour/white text) both in the account drawer and in the holdings view. In holdings each category header shows its **category total** right-aligned; the portfolio counts as one line (portfolio value) towards the **total** (in a neutral grey/black). The split comes from the .kmy.

Portfolio (securities)

After importing a KMyMoney investment account, the **portfolio** appears in the account drawer. The view is laid out like an account view – same title bar, same drawer, same filter – and shows **shares × price = current value** per security. Fully sold securities are hidden.

The **balance line toggles by tap** through: portfolio value → buys → sells → dividends → **net invested** (buys – sells – dividends) → **gain/loss** (coloured, with percentage). Sells and dividends only appear when there are any. The portfolio value is kept separate and also appears as „Net worth“ in the main screen's balance line.

A tap on a security opens its **movements full-screen** – buys green, sells red, dividends neutral – with the same figures for that security, a filter by buys, sells and dividends, and a date slider starting at the first purchase.

The **portfolio filter** narrows the securities by name and value; like in the booking filter the slider works in shares, not in amounts. When you scroll far down, the **scroll-to-top button** at the bottom left jumps straight back to the start.

Pioneer Tech Innovators ETF -	

Portfolio view:
securities with
shares, price
and current
value

A **short tap** on a transaction shows the figures behind it: for **Buy** and **Sell** the number of shares, price per share, amount, fees and the resulting total (charged on a buy, credited on a sell); for **Dividends** the shares held, the gross dividend per share, the gross amount, taxes and charges, and the net amount; for **Add** and **Remove** the number of shares. **Fees** only

For **Add** and **Remove** transactions, KMyMoney only ever records a share count, never a monetary value. A **long press** on such a row opens a dialog to set the value manually (using the same calculator keypad as elsewhere) – it then counts like a buy or sell towards the cost basis and gain/loss, and survives a fresh portfolio import.

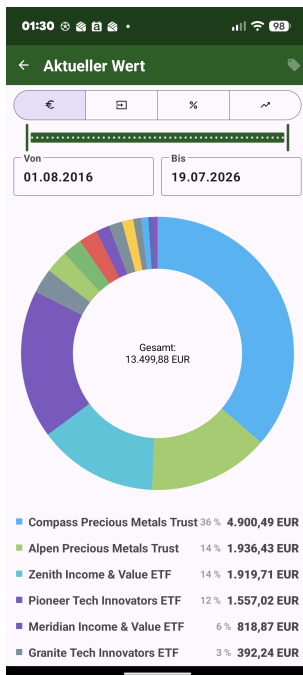

A securities purchase also appears in the booking list of the settlement account – as a transfer between that account and the security. Open it and **amount, payee, accounts and date are locked**. The reason: **shares and price** belong to this booking but exist only in the KMyMoney file. The app does not know them – were it allowed to write the booking back like an ordinary transfer, the securities purchase in your file would have turned into a bare transfer, wrecking the portfolio there.

Ausgaben · User Manual (Version 1.10)

Deleting works - unlike editing

„Delete“ is available here, and it takes the matching **portfolio movement** with it; otherwise a movement without a money booking would be left behind. Why this is allowed where editing stays locked: deleting removes the **whole** transaction – money, security and fee parts together. Nothing can be left half done, and that was exactly the reason for forbidding the edit.

If the booking is already in the KMyMoney file, the confirmation says so plainly: on the next export the transaction is removed **there** as well, including shares and price. **There is no undo** – the booking could be restored, the portfolio movement could not, and half a way back would be worse than none.

Portfolio analysis: icon toggle, period filter and pie chart

The „Analysis“ menu opens a **pie chart** of the securities – styled like the Categories page (continuous ring, a fixed colour per security, at most half the screen height, with its own scrollable list below). The slices are unlabelled; a tap shows the **name and amount** of the security in the centre, with nothing selected it reads „Total“. Chart and list are **always** sorted descending by the current value of the period.

At the top an **icon toggle** picks the view: **Current value** (default, € symbol) · **Net deposits** (arrow) · **Total dividends** (% symbol) · **Gain/loss** (trend arrow). Below it a **period filter** narrows the analysis – a monthly range slider (first portfolio transaction to today) plus two **From/To** date fields for any date. Any change to the view or period updates chart and list immediately.

- **Current value:** today's value (current price) of the **positions built** in the period – i.e. the shares bought within the period that are still held. Over the full period this equals the current portfolio value (shares sold again within the period do not count negative).
- **Net deposits:** buys – sells – dividends within the period.
- **Total dividends:** all dividends received within the period (gross/net per the setting).
- **Gain/loss:** current value – net deposits, per security as a € amount and as a % return on cost basis (buys) – coloured green/red in the list. The pie-chart slices keep the security's normal colour.

In the **toolbar** an icon shows or hides **fully sold securities** (hidden by default). What counts is the net holding **at the end of the selected period** – a sale after that does not yet count as „fully sold“.

Dividends gross/net: the settings let you choose whether dividends are shown gross (declared dividend) or net (cash received after tax) and used in the balance line (dividends, net invested, gain/loss).

Reading a statement: the portfolio can read a securities statement from a PDF and prepare a booking from it. The feature ships **switched off** and can be enabled in the settings, where the app also states how many banks the recognition was measured against. It does not work

with every bank – **check the recognised values before you book.**

Values inside a table

Some banks do not put the figures behind a label but **under a column heading**. The data row then starts with a number and carries no label of its own. For such statements **„on one of the lines below“** means: the next line that carries a value at all – up to three lines away. That skips a second header line, which some banks insert. If the search gets stuck on an in-between line that happens to carry a number, pick **„exactly 1, 2 or 3 lines below“** instead.

A table row often carries several entries of the same kind – the booking day first, the value date next to it. Which one is meant is set by **„Which number on the line“**; it applies to dates as well. For dates the default „the last one“ still means **the first** entry after the label, out of consideration for older rules – if you want another, pick „the first (table column)“ or „the 2nd from the left“ explicitly.

Help while typing: under „Check statement“, next to the result, sits the button **„Text with line numbers“**. It shows the statement the way the app reads it. That is necessary because its lines are not the lines of a PDF viewer: they come from the word positions, and a visually empty line does not exist there at all. For counting the distance it is the only reliable source.

A fee that is not on the statement

Some banks charge a fixed amount per order without printing it on the statement. A rule cannot find it – it searches for a label, and there is none. On the rules page the **fee** therefore has a field **„Fixed fee per order“** together with a category.

Whether that amount applies is decided by the **„Add up several lines“** switch above it. If the rule finds no fee in the document, the fixed value applies. If it finds one and the switch is **on**, the fixed value is added. With the switch **off** the fee found in the document wins and the fixed value stays out.

Next to the **total** sits the switch **„Fixed fee is already in the total“**. With it off, the debited amount is higher than the figure on the statement by that fee – for a sale the credit is lower by it – and the app adds it in. With it on, the total stays exactly as printed.

Recognised by itself: if you enter a total and a fee that are **both** absent from the statement, the app tries the difference – the amount without the fee. If it finds that, it learns its label and records the fee as a fixed order fee right away. This is the only value the app does not read but infers; the confirmation therefore names it explicitly, with the amount.

15. Synchronizing: performing export and import

The actual sync with KMyMoney runs through a **single symbol** in the main screen's title bar – the **export/sync symbol** (down arrow).

The export/sync symbol in the title bar (circled in red)

Exporting bookings

Tap the export symbol ↓. The app loads the current .kmy from the sync target, inserts your new bookings, makes a backup first (see below) and writes the file back. Each booking is exported only **once** and then marked „exported“. In CSV mode one CSV file per account is uploaded instead.

Edited bookings. Change a booking that is already marked „exported“ and it carries „edited“ afterwards (yellow in the list). The next export does not add a second transaction: the existing one in the .kmy file is **changed** instead – the same transaction in the same place, no duplicate; the booking then reads „exported“ again.

You cannot set this status yourself: it only arises from a change, and the „Marked as exported“ switch in the booking editor is locked then. If you switch it off yourself while editing, your choice wins – the booking is „not exported“ and will be written as a new transaction on the next export.

A **transfer** behaves the same way even though it consists of two rows: in the file it is one transaction and is changed once.

When the change does not arrive

If the old transaction is no longer in the file – deleted on the computer, say – the message says so and the booking stays „edited“; nothing is inserted. Re-import the .kmy file in between and the file wins: the edit is gone.

(Re-)importing accounts

Import is done selectively via the account drawer (long press):

- **Long press on an account:** imports/updates exactly that account from the .kmy.
- **Long press on „All accounts“** (or pull down in the „All accounts“ view): reloads **everything** – accounts, portfolios and scheduled transactions, from a single download.
- **„Add account“:** fetches an account not yet present from the .kmy. In the picker you can tick **several accounts (and portfolios) at once; already-imported accounts (including closed) and portfolios are hidden.**
- **Long press on the portfolio** (or pull-to-refresh in the portfolio view): updates securities and prices – also in the background with the yellow progress banner.

Securities buys and sells (money from the account into a security or back) are imported as a **transfer** into/out of the security. The small **fee** (or tax) inside the transaction does **not** appear in the booking list and changes no balances – but it is counted as a small expense in the **category evaluations** (chapter „Where does my money go?“ and Budget). **Dividends** stay normal income.

An import replaces the already-exported bookings per account (no duplicates). The import runs **in the background** – the UI stays usable; a **yellow banner** at the top of the booking list („Importing account ...“) with a moving gradient, status text and percentage shows the progress and disappears when done. A message appears **only on error**. In **CSV mode with SMB/WebDAV**, adding an account or long-pressing one opens a **navigable folder browser** (subfolders  + CSV files, „..“ to go up); the chosen CSV is imported from the current folder. The drawer stays open on long press.

Backup before every export

Before every write-back the app automatically creates a **timestamped backup** of the .kmy (e.g. *file.kmy.bak-YYYYMMDD-HHMMSS*). The backups go into the **„Backup“ subfolder** next to the original; the folder is created automatically the first time. So you always have a fallback in case something is ever wrong with the file, and the actual folder stays tidy.

Protection against overwriting

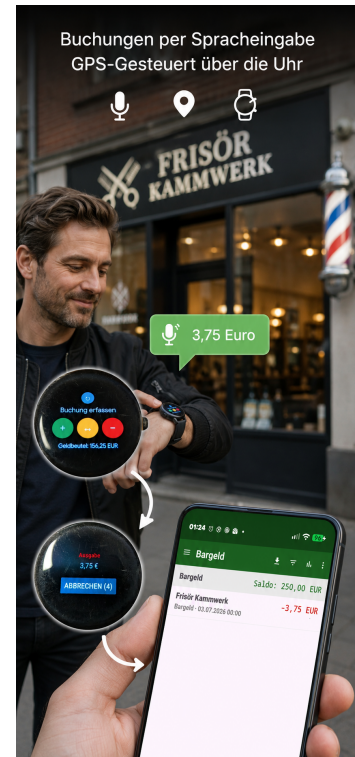

A few seconds pass between downloading the .kmy and writing it back. If somebody works in KMyMoney on the computer during that window, their changes must not be lost. The app therefore remembers the **state of the file** when downloading and only writes if it is unchanged.

If the file changed in the meantime, the **export aborts and writes nothing**; the bookings stay unexported and can be exported again after a fresh import, without any loss. If the server reports no state, the app writes unchecked – the export never fails because of this.

16. Wear OS (watch)

With the watch app you record an expense by voice right on your wrist. The watch only captures the text; processing and creating the booking happen on the phone.

- **Three type buttons:** income (green), transfer (yellow), expense (red). Then voice starts.
- The recognized text is shown briefly with „Cancel“ and otherwise processed automatically.
- **Silent digit entry:** enter an amount silently via the digits symbol (resolved by location on the phone).
- **Wear tile:** quick access as a tile.
- **Default-place balance:** below the buttons, the app and tile show the balance of the default place as „Place: balance“ (e.g. „Wallet: 70.00 €“). With no default place set, the line stays away.
- **Offline:** bookings not yet transmitted are shown and delivered automatically once the phone is reachable – without loss and without duplication.

Recording on the watch

Switching account and place

Above „Record booking“ a grey **switch button** – in the app as in the tile – cycles through the shown account and its places. The next booking, from the phone widget as from the watch, then targets the chosen account. After a short while the selection reverts to the default place by itself.

For a **transfer** the chosen account is the from-account and the to-account is the default account. If the chosen account already is the default, the to-account stays empty and is filled in on the phone.

When a reason appears instead of the balance

While bookings are **not yet transferred**, the reason takes the place of the balance: „Waiting for GPS“ (the location is still being resolved), „No connection to phone“ or „Transferring...“. The line below still states the count.

Recording offline (phone off or disconnected)

Speech recognition uses the **language chosen in the settings** (including uploaded ones) and **prefers offline** recognition, so recording works even without the phone/network – provided an offline speech model is present on the watch. If offline speech fails, the watch automatically opens the **number pad**: you just type the amount, the booking is **buffered including GPS** and sent automatically once the phone is reachable again (the payee is resolved by location on the phone).

So that **voice** recording works offline, the **offline speech model** of the chosen language can be installed on the watch. On the phone, enable the setting „**Install offline speech package on the watch**“ (only in the GitHub build with the Wear bridge). On Wear OS 4+ the watch then triggers the download automatically (once, when a network is reachable); on

older watches a hint appears to load the model in the watch's system settings. Without this switch, the number-pad fallback applies.

Requirement: the phone and watch apps share the same signature (same key).

17. Settings (complete reference)

The settings are reached via the **⋮ menu** at the top right - entry **„Settings“** at the very bottom. On first start the welcome assistant (Chapter 3) already sets the essentials; here all fields are described in screen order. Changes take effect on **„Save“** (language and dark mode immediately).

The image shows three screenshots of the KMyMoney app's settings screen, categorized into three groups:

- Language, number format, server connection:** This section includes settings for the app's language (Deutsch), currency symbol (EUR), number format (1.234,56), and server connection (Nextcloud). It also features toggles for displaying currency symbols, dividends, and budget calculations.
- Export mode, default account, places per account:** This section includes settings for the export/import format (KMyMoney-Datei (.kmy)), the default account (Bargeld), and the default location (Bargeld). It also features a toggle for testing the connection.
- Appearance, security, data:** This section includes settings for the app's appearance (Dark Design), security (App with Biometric Protection), and data (Data Backup, Data Reset). It also features a toggle for displaying currency symbols.

Language, number format,
server connection

Export mode, default account,
places per account

Appearance, security, data

Language, number format and currency

- **Language:** German/English (more via a language file). Pre-selected from the phone on first start; the choice takes effect immediately. Via **„Export/upload language template“** you can maintain your own translation as a file.
- **Currency:** default currency symbol for accounts without their own currency (taken per account from the file on .kmy import).
- **Number format:** „1.234,56“, „1,234.56“ or „1234,56“/„1234.56“ without grouping; plus the **„Show currency symbol“** toggle. Applies to all amounts in the app and on the watch; the export keeps a stable format.
- **Dividends gross/net:** whether portfolio dividends are settled gross (declared) or net.
- **Read statements:** allows reading the bank's PDF statements in the portfolio (default: off). When switched on the app states how many banks the recognition was measured against (see Chapter 14).
- **Budget in-app:** compute the budget actuals from history instead of importing from KMyMoney (see Chapter 12).

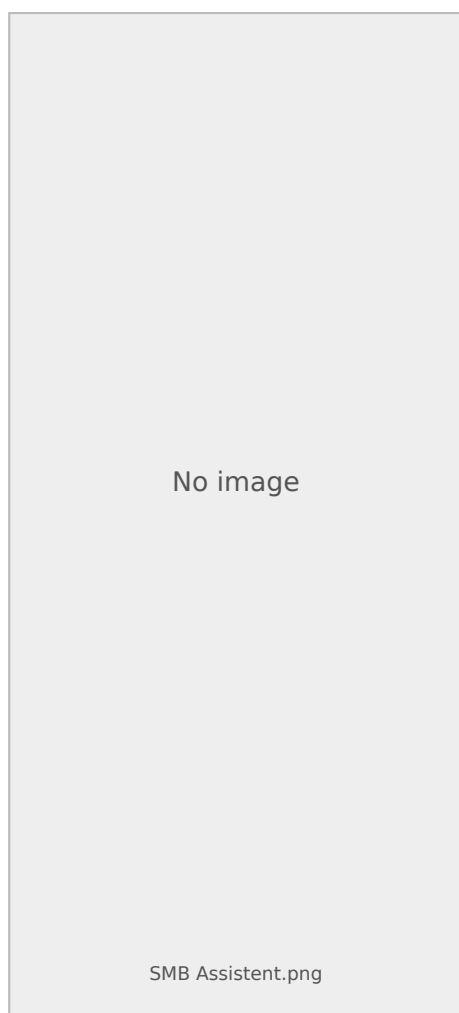

- **Install offline speech package on the watch** (GitHub build with the Wear bridge only): lets the watch download the offline speech model of the chosen language so voice recording works offline too (see Chapter 16). Off → the number-pad fallback applies offline.

Connection to your server (SMB / WebDAV / Nextcloud)

The most important setup step, so the app can exchange data with KMyMoney. Choose the **server type** and enter the access:

- **Nextcloud**: base URL of the server + app password (Nextcloud → Security → App password).
- **WebDAV (generic)**: full DAV root URL, auth via HTTP basic.
- **SMB/Samba**: set up through a **wizard** – see below. SMB2/3.
- „**Test connection**“ checks the credentials.

Setting up SMB/Samba (wizard)

SMB wizard: servers found, sign-in and share selection

With server type **SMB/Samba** a wizard replaces the address fields, so you don't have to remember host or share names:

1. **Search for servers.** On opening, the app scans the local network automatically. Each hit is listed with its display name and IP address; „**Search again**“ restarts the scan.
2. **Log in.** Enter username and password of the server. The password is stored encrypted and never shown in clear text.
3. **Pick the share.** The app reads the server's shares; clicking one fills the „**Share name**“ field.
4. **Save.** This becomes the address „smb://host/share“. The **target folder** inside it is then chosen with „Browse folder“ or „Choose .kmy“.

When the server does not listen on port 445

A share without a password

An empty user means guest. For a share without a password simply leave the password field empty – the app then continues as guest, even with a user name filled in.

Above the login fields sits a „**Port**“ field. Leave it empty as long as the server uses the usual SMB port 445. If it announces a different one over Bonjour, that port is already filled in; if nothing answers there, the app also tries the default port 445 and corrects the stored address. The address then reads „smb://host:7777/share“.

Further details

The scan runs three ways at once: Bonjour/mDNS, a NetBIOS name query and a connection test on the SMB port. The servers found last time are remembered and shown right away when you open it again.

If the server belongs to a **workgroup** other than „WORKGROUP“, the field is already pre-filled – the search names it below the server name whenever the server reports one. If it refuses to list its shares either, type the share name by hand; system shares such as IPC\$ are hidden anyway.

„**Enter server manually**“ brings back the classic fields for typing the address yourself.

„**Search for servers on the network**“ returns to the wizard at any time.

Workgroup or Windows domain: at home the workgroup is usually called „WORKGROUP“ – it plays no role for signing in, Samba servers and NAS boxes only check user and password. It is different in a real **Windows domain (Active Directory)**: there you enter the user as **DOMAIN\user** (or as „user@domain.local“). Without the domain the login may fail with „Username or password is invalid“ even though the password is correct. For a Windows PC with a local account, „COMPUTERNAME\user“ helps.

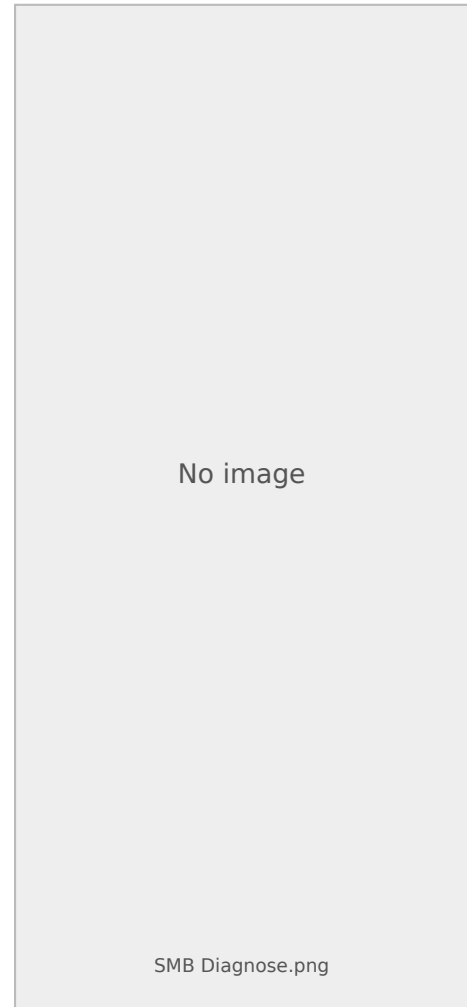

If something fails, the wizard names the reason: „Server not reachable“, „Username or password is invalid“, „The selected share is not available“ or „Access to the folder was denied“ – followed, in brackets, by the server's **raw status code**, so a report can actually be traced. „Server not reachable“ only ever appears while no connection has been established yet. If the port field does not hold a number between 1 and 65535, it says so right away without trying to connect.

Check connection (diagnostics)

The button „**Check connection (diagnostics)**“ – in the settings **and** in the first-start wizard – walks the whole chain in **one** login and shows, for every step, whether it worked, how long it took and, on failure, the raw status code:

- **Connect** (noting it if the default port was used instead of the configured one),
- **Negotiate**: which SMB dialect, whether the server requires signing and whether encryption was negotiated,
- **Log in**: as a user or as guest, encrypted or not,
- **Read shares, open share, read folder**,
- **Write in the folder** – the app creates a tiny test file and deletes it right away. A **read-only** directory would otherwise only surface when writing back, that is after you have already recorded bookings.
- **Check the file** and, if it exists, whether it is **writable** (.kmy mode only).

„**Copy report**“ puts the result on the clipboard – meant for sending along with a bug report. The report contains **neither the password nor the user name** (only „set“ or „empty“).

Diagnostics: every step with duration and status code

Export mode

- **.kmy mode**: writes new bookings straight into the KMyMoney file (including splits and transfers) and imports accounts/bookings as well as the portfolio from it. „**Choose .kmy**“ opens a file browser (subfolders, „..“ to go back).
- **CSV mode**: exports one CSV file per account (each booking only once); the target folder and import folder are set here.

Without a configured sync target, export goes locally into a folder you choose. How the sync runs is in Chapter 15.

Default account and places

- **Default account**: pre-selection for new bookings (also for widget and watch). Selectable only once accounts exist.
- **Places per account**: per account you can create cash **places** and set a **default place** (see Chapter 14).

Alias names

The „**Prompt**“ toggle controls whether the app offers to learn an unknown payee as an alias after you speak (existing aliases still apply). Via „**Manage alias names**“ you create, edit and delete aliases by hand – with spoken term, real payee, booking type, account, categories and location (via „**Open map**“ on an OpenStreetMap map). The „**prefer**“ toggle (★) puts an alias ahead of the booking search; the same term may point to several payees distinguished by location.

Appearance

- **Dark mode:** light/dark (takes effect immediately).
- **Reminder for scheduled bookings:** reminds once a day of scheduled bookings due today (off by default; see Chapter 13).

Security & privacy

- **App lock:** optional via biometrics/device credential (fingerprint, face, PIN, pattern, password) – on start and when returning from the background. When the app hands over to another app itself – camera, gallery, file picker, speech input – returning within five minutes does not ask again. Stay away longer and the lock is back.
- **Location (GPS)** switch (default **off**): controls all location use. Off = no permission prompt, no GPS note, no amount-only entry, no alias location. The position is used locally only, never sent to a service.
- **Use amount for payee suggestions** (default **off**): on = the amount helps decide where several payees share a location – in the number pad the name shown changes with the amount, and the booking editor pre-fills an unambiguous payee. Off = both stay quiet; the number pad shows the nearest payee, which you change by tapping. **Regardless** of this switch, plain **voice entry without a payee** – on the phone as from the watch – always uses the amount, because there is nothing to choose there.

Data

- **Export all** and **Create/restore backup** (see below).
- **Manage accounts (delete/close):** a **multi-select** lists all accounts with status (Active/Closed). The bottom row has (context-dependent) **Close/Reopen** and, on the right, **Delete**; **Close** only at balance 0, **Reopen** only for closed accounts. A closed account no longer appears anywhere – only in the total analysis view does its historical balance still count.
- **Reset data:** deletes the local database (a fresh start like the first time – the welcome assistant appears again afterwards).

Creating and restoring a backup

„**Create backup**“ writes **data and settings** into a ZIP file: the database (bookings, accounts, place journal, portfolio, schedules) *and* all settings – including the places per account, the category colours and the server access. Beforehand the app asks two things:

- **Include the server password?** **No** by default – then the password appears nowhere in the file and is entered once after restoring.
- **Backup password** (optional, entered twice): it encrypts the **whole file** (AES-256-GCM, file extension *.abk* instead of *.zip*). Without a password it stays a plain ZIP.

On „**Restore backup**“ the app first asks for the backup password if needed, and then **what** should come back: **data only**, **settings only** or **both**. That way a broken configuration can be repaired without touching the recorded bookings. The app restarts afterwards. Receipt photos are not part of the backup – once uploaded they live on the server.

Disclaimer

This app is provided as-is, with no warranty. In particular, there is no guarantee that the .kmy file remains fully valid after an export. Thanks to the automatic backup before every export, however, you always have a fallback. Keep your own regular backups as well.

18. CSV format (export)

German locale: column separator „;“, decimal separator „,“, date DD.MM.YYYY, UTF-8. Split bookings are written as one line per category.

```
Datum;Empfänger;Konto;Typ;Betrag;Notiz;Kategorie  
29.06.2026;Metzgerei;Bargeld;Ausgabe;-7,30;Mittagessen;Lebensmittel
```
